Subject: RE: [tvnsp] Re: etrex questions

I'm running off memory from when this whole fracas hit the fan years ago, but I beleive that GIF (Graphic Interchange Format) was developed for (by?) Compu$erve for their online pictures. However, it became extremely popular over time. Compu$erve decided to start charging on their license when they saw the large number of freeware, shareware, and commercial programs out there using it. Like any good business, they thought, hey, here's another revenue source. However, there was such an uproar over it that in essence, Compu$erve dropped the idea of charging for the GIF due to the backlash. Though they retain the license (and patent?) on GIF, the use of it is essentially public domain. Anyone can use it and you don't have to pay to use it. What you may have to pay for is the picture itself, not all pictures are royalty free. That is, you're paying for the use of the picture, not the use of the picture format. It's always a good idea to get (written) permission from the photographer or owner of the picture if you want to use it.

I'll not comment more on the topic of JPEG (Joint Photographic Experts Group) vs GIF, other than to say that the general recommendation, especially with web pages, is "GIFs are best for displaying noncontinuous-tone images, or those with large areas of flat colors. JPEG is the superior format for photographic or continuous-tone images, because they can contain millions of colors."

JPEG files tend to be larger than GIF and PNG (Portable Network Group) files PNG is the native file format of Macromedia Fireworks, retaining all the original layer, vector, color, and effects information (such as a drop shadow, and all elements are fully editable at all times.

73 de Bill, KC7JSD
-----Original Message-----

One problem with the GIFs however, is they have a very restrictive licensing agreement. I have a feeling that it is seldom enforced by the number of

freeware/shareware software vendors that include the format, but technically any program that saves GIF files is required to pay some organization a sizable chunk of change - if memory serves me, this chunk is somewhere on the order of $100 per software client (i.e. $100 for every copy of PhotoShop sold).

4539. Lithium Batteries.

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-10-04 00:58:40 UTC
From: K. Mark Caviezel
Topic: 4539 Message: 4539

Paul:
mmmmmmmmm really should dig up my numbers on this, but please note that Lithium batteries have different rated capacities at different temps. A while back, I got a bunch of data together and put it in a spreadsheet. I will dig it up and send it to you. I think that the Li 9V batteries have HALF the rated capacity at -20 C as they do at +20 C.
And for what it's worth, I guess it's reasonable to mention that there are lithium sulphur dioxide batteries with a nominal voltage of 3 V and lithium manganese dioxide batteries with a nominal voltage of 1.5 V (these are the AA batteries). I measure 1.7 volts open circuit on my AA's when they are brand new at at room temp. Their open circuit voltage did sag a bit when exposed to ??40F?? temps during the prelaunch preps for EOSS 55.
Additionally, Mike Manes, W5VSI informed me of the 'wake up' effect with the mil surplus LiSO2 that he uses in the EOSS ATV module. He measures higher voltage after the cell has been drawn on for a while. I *think* but am not positive that I saw the same 'wake up' effect with LiMnO2 AA batteries once when I ran them in my dash board GPS unit. (it was an accident, and why I haven't hooked up the power cable yet is anyone's guess)

anyways, my $0.02. I'll dig up my spreadsheet of battery caps and characteristics and get it out to you.

Hi John,

Give Deb our best wishes. I hope she has a quick recovery. Tell her to
hollar if there is anything we can do. I went through this same
procedure and I know what she's up against? Also, which hospital is she at?

Not that it's any of my business but can you tell me if they used her
patella tendon to recreate the ACL or did they do a donor graft?

Thanks, I'd like the information. The photo-lithiums at Wal-Mart are
a lithium-iron disulfide chemistry. They produce 1.5 volts per cell.
My notes say the lithium-managese chemistry produces 3.0 volts
per cell.

At room temperature, I get 1900 mAh at 160 mA from the batteries.
They're rated for 2900 mAh if the current is really low.

Rats, to hear about the drop in capacity at colder temperatures.
The interior of my capsule doesn't drop below 40 deg F. If you have
capacities for lithiums at these temperatures, I'd like to list them in
my book if that's alright with you (I'll give you credit for the
numbers).

Robotic arm? Capsule? With these two in the same sentence, I have to ask, "What's this all about?" I've been skimming mostly, and there definitely isn't another post with "Robotic Arm" in the subject line here.

You know, with this robotic arm properly designed and programmed and in the Pine Tree Capsule, it could have fingerwalked itself off the tree branch....

Dave,

I can just make you a copy here. It took 8 disketes for all of the pictures (both attempts) 3 for the initial flight and 5 for last weeks adventure. Do you want both? I can also put everything on a cd disc if you like, just tell me what you want and I can copy or burn it for you. Also, I've been trying to e-mail you all week but my mail is being rejected by HP. I would like a copy of what you have though. Thanks

Justin

yikes, my mail is being rejected?
you know they just changed (reciently) from
firstname_lastname@...
to
firstname.lastname@...
so that could be it, note the "." vrs the old "_"

I wonder if they were being rejected due to size?
Yikes! Lets do whatever we have to do! :)
If we have to, a CD is fine.
I'll email you directly with the pictures i have!
Justin Formolo wrote:> I really would like a copy of Justins pictures can someone copy the disk(s) for me? naturally i can reemberse for media costs...

Dave,

I can just make you a copy here. It took 8 disketes for all of the pictures (both attempts) 3 for the initial flight and 5 for last weeks adventure. Do you want both? I can also put everything on a cd disc if you like, just tell me what you want and I can copy or burn it for you. Also, I've been trying to e-mail you all week but my mail is being rejected by HP. I would like a copy of what you have though. Thanks

Justin

Bill,

Paul has a robotic arm for his capsule that has a camera on
the end of it. I don't know if he has flown it yet. It's a
video camera to be used with ATV equipment.
See you at the meeting.

4564. PC Working Party Tomorrow- 10/5

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-10-05 05:03:42 UTC
From: Mike Garske
Topic: 4564 Message: 4564

Everyone,

Here are the directions to my house......be here after 5pm tomorrow 10/5... My phone number is 846-9219, and I will also be monitoring the 147.240 repeater. Anyone is invited to join us to help inventory and check out the PCs that were donated to us from Simplot Transportation.

==========
Head to Meridian!

Go West on Cherry Lane to Haven Cove. This the last street before you hit Ten Mile Road.....Take a left onto Haven Cove. Go up to about 2 blocks to the T-Intersection. This is Sheryl Street. Take a Right. My house is on the left side, the address is 2923 West Sheryl. Any questions, give me a call on the phone or on the radio! Bring whatever refreshments that you like, looks like it will be a pizza party also!

Email or call me if you plan on showing up, so I know who to expect!

Mike KC7DPD

4565. TV02F Recover Pics

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-10-05 16:23:22 UTC
From: Russ Dunn
Topic: 4565 Message: 4565

I added some of my photos from last week's capsule recovery. They are on the yahoo TVNSP website under Photos and the folder TV02F. This is not a new folder, just has new pictures added.

Yes, it really can take 1.75 hours to walk 1 mile downhill--without a trail, with a 25# pack and hiking over logs and around waterfalls :o)

Please, don't anybody calculate how much money we all spent in gasoline in 3 attempts just to drag this sorry lunchbag down out of a tree. We don't want to be reminded.

It's not just amateur science--IT'S AN ADVENTURE!
(Trademark, TVNSP)

From Russ. It sounds like a good idea to me to use the yahoo
calendar.

Paul

Suggestion: there is a calendar on the yahoo site, but it has no dates in
it for the meetings, launches, etc. Not sure who can post to it. Guess I
could try to upload my pictures from TV02F retrieval and find out if I have
access.

4570. Friday's Meeting.

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-10-06 14:15:46 UTC
From: Jeff Melanson
Topic: 4570 Message: 4570

Hi all,

Paul did his presentation on how to make circuit boards.
This will be repeated when we do the BASIC Stamp classes.
Mike will write an announcement for the VOI news letter for
the BASIC Stamp classes starting in November.
There was some discussion about having participants work on
specific projects for the capsules. Tony wants to add an
accelerometer to measure vertical forces during a flight. I
want to work on methods of accurately determing when the
balloon bursts. Doug suggests we fly the simplex repeater
again and add a repeating message that announces what is
going on and how to use the repeater. There was some
discussion about changing our cutdown devices to be able to
accept a command from the ground.
We also made plans to meet at Mike's house to check out the
computers that were donated to TVNSP. We did this Saturday
evening. We tested all the computers and monitors. Some
monitors were bad and some computers were designated as
parts for other compputers. In other words we'll take the CD
roms and memory and hard drives and place them into other
machines to improve them. This work will be completed later.
The pizza was good and so was the documentary on early
rocket failures in the space program.

4572. New NSTAR video up

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-10-06 20:54:18 UTC
From: Mark Conner
Topic: 4572 Message: 4572

I have posted a video clip of the first 5 minutes of the NSTAR 02-E flight at:

http://68.13.112.250:14480/NSTAR02E/NSTAR02E-air.rm

The video is about 5 minutes long and 13 Mbytes. You can see the hot-air balloon at about 3 minutes into the clip.

My free dynamic DNS service has gone to a pay business model. I'm in the process of signing up for another service - trying to decide whether to buy n9xtn.org for $30 or just get a free one from DynDNS.

>from DynDNS.

Well, I wouldn't pay $30 these days. There are several registrars selling domains for much less than that. I had a friend that I trust recommend godaddy.com. I've got a couple of domains registered with them now and am thinking about moving some others. Frankly, VeriSign pretty well screwed up Network Solutions and it just isn't worth paying 3-4 times as much for the same thing.

Note that I haven't had any problems so I haven't had opportunity to try their tech support.

Of course, the $9 (or so) that godaddy.com charges is simply the registration. There are hosting companies around that are relatively inexpensive, but it would be worth looking for donated space too.

Bill

Paul
What was the name of that website to down load the
trial version of the circuit CAD program you showed us Fri.?

I found it at a UK site,but they kept wanting money (pounds).
I don't buy anything unless i can try it first.

Paul,
The meeting is on the 17th at 7 PM at the Pizza Factory, 102 W. 5th. To get there, take Hwy. 44/State St. to Hwy. 16 between Eagle and Star. Go North on Hwy. 16 and drop down in to the Emmett valley. Continue on Hwy. 16 to the traffic light at the end of Washington Ave., between Chevron and Maverick. Take a right on Washington Ave. (at the light) and go approx. 9 blocks to 5th St. (one block before the next light), turn left, and you're there. I'll contact KC7VOJ to see about his LCD projector. And yes, it is an eating meeting and the pizza's pretty darn good.

I'll need directions and a time for the Emmett meeting. Can anyone lese from TVNSP make it? We'll give a slide and video show. We'll also pass around equipment.

Is the Emmett meeting an eating meeting like Boise VOI?

Rus, we have one PC ready for your friend. We need to arrange for
him to pick it up. It's a P-133 with a 2Gb HD. I believe it has 32Mb
RAM (can someone confirm that?). It uincludes the monitor,
keyboard, and mouse. The OS needs to reloaded. We're asking
$50. The money goes to the VOI's balloon fund (us).

I am available this friday. When/where is the meeting?
I'll bring my laptop, and some CD's with the pictures on it, maybe we can show some photos as you suggest.
Thanks
verhap@... wrote:
The BAS meeting is this Friday (that's three meeting for me this week). Jeff or Dave, can you attend to discuss the recovery? i'd like to show a slide of the winds we encountered. Can we show some photos? I'll bring a laptop and confirm a LCD will be available.

Everyone else is invited also. Please think of something to say. this is your chance to speak in benefit of TVNSP.

This one actually looks encouraging! Quick question though - the default pad sizes on the IC's are a bit skimpy for my tastes, is there a setting available to use a slightly darker pad?

Can anyone testify to the program's (ARES) stability?

The pink pads represent pads on all layers of the board. I select
bottom copper and click on all the pads.

> Can anyone testify to the program's (ARES) stability?

I make all my PCBs with it. My book is filled with it.

Proteus is an entire suite of software, one of which is Ares.
Other software includes a schematic capture for those too lazy to
input their own schematics.

Ares should have a shareware version that is limited to 100 pin
holes.

4607. Work Party

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-10-08 17:24:14 UTC
From: John Knapp
Topic: 4579 Message: 4607

We were initially thinking of having a work party to build PCB, hardware, etc. on Oct. 26. However, that weekend is between the two launchs, one on Oct 19 and the other on Nov. 2. My thought is to wait until later to start working on the hardware. Do we still want to meet on the 26th to review the launch of Oct 19th and to prepare for the next launch?

If so, where do we want to meet? The Jade Garden or somewhere else? And when. Lets have some feedback from the group so we can do the back-to-back launches successfully.

I say put off the hardware stuff till the snowballs fly.

We need to concentrate on the two planned launches.
Reviewing the first launch with preparation for the second one
at the same meeting would be good. Any mistakes made on
the first one will be fresh in our minds to correct for the
second one, not that we are not perfect by now ;-)
Also cuts down on my gasoline bill with one less trip.

Jade Garden works for me.

My meager input,

Randy

Word help says:

Turn on or off automatic spelling and grammar checking
On the Tools menu, click Options, and then click the Spelling & Grammar tab.

Do one or more of the following:
To turn on or off automatic spelling checking, select or clear the Check spelling as you type check box.

To turn on or off automatic grammar checking, select or clear the Check grammar as you type check box.
Note When you turn on automatic spelling and grammar checking, Microsoft Word clears the Hide spelling errors in this document and Hide grammatical errors in this document check boxes. This enables the spelling and grammar checkers to mark possible errors with wavy underlines. If you find the wavy underlines distracting, you can select these check boxes.

4618. TVNSP launch procedures: Go/ No Go

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-10-08 19:17:45 UTC
From: Hank
Topic: 4579 Message: 4618

> We need to concentrate on the two planned launches.
> Reviewing the first launch with preparation for the second one
> at the same meeting would be good.

TVNSP needs to formulate responsible, common sense policy
and guidelines governing when launches should be postponed
to the next day or next week.

Other balloon groups in much easier terrain than
Idaho/western Oregon are not at all reluctant to postpone
launches.

I'm somewhat concerned that there has been no discussion
on list of how to avoid a repeat of 02F (landing a balloon
in an area from which recovery is very difficult; changing
balloon and payload configuration only hours before launch).
I'm told that there was no such discussion at the recent TVNSP
meeting either.

02F should be the last wakeup call for TVNSP to take
responsible, thoughtful action about how it operates in the
form of a written set of procedures concerning wind and other
weather conditions as criteria for a launch postponment.

Sincerely,
Hank Riley

TVNSP needs to formulate responsible, common sense policy
and guidelines governing when launches should be postponed
to the next day or next week.

Hank,i think we most precautions necessary to prevent failures. We may not do it like every other group and we probably never will. So far,the person who has the most interest or ownership of the balloon makes the final decision to go or not go after all the planning and on the spot adjustments.
We have all the necessary set plans, check off sheets and common sense in my opinion.

Other balloon groups in much easier terrain than
Idaho/western Oregon are not at all reluctant to postpone
launches.

I think we will abort if the conditions deem necessary.
Remember we are a bit "western" and that implies we
like to break new ground. If you can adjust to conditions
this adds to the challenge in my opinion.
When my time comes to launch,and everything looks right on paper and the group says 'OK", but my gutt feels wrong, rest assurred i will over ride any plans and abort.

I'm somewhat concerned that there has been no discussion
on list of how to avoid a repeat of 02F (landing a balloon
in an area from which recovery is very difficult; changing
balloon and payload configuration only hours before launch).
I'm told that there was no such discussion at the recent TVNSP
meeting either.

I believe we discussed changes at last Friday's meeting quite well. Cutdown device changes,larger landing zones to allow for unreliable burst data on the smaller sized balloons. Sorry we forgot to put it on this list.

Adaptation to last minute changes is not bad
as long as everyone agrees. If someone did not,then they should have spoke up. I was not at the T02F launch
so i do not know any specifics.

02F should be the last wakeup call for TVNSP to take
responsible, thoughtful action about how it operates in the
form of a written set of procedures concerning wind and other
weather conditions as criteria for a launch postponment.

Written procedures are followed when i have been at most launches. Hank,we take your input and all of the other great balloon people and use them to the best of
our ability. Sorry if you feel different but we are
movin and shakin (as the kids would say) at our own pace.

I have always figured if you never make a mistake,then
you might not be learning enough. My most memorable learning experiences have been from small and large mistakes.
This is a hobby,when it goes professional,then i look for another one.

Thanks for the concern and input Hank.

Goin Huntin,so this will be my last mail till the 14th.

Randy

4621. dealing with 200 gram and other small balloons

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-10-09 01:38:32 UTC
From: Hank
Topic: 3022 Message: 4621

> Hank - Have you been able to figure an error factor based
> on the two flights with 200gm balloons? It seems like you
> might be able to work from the starting data and the known
> burst altitude to figure out how far off the burst volume is.
>
> Bill

Figuring a corrected burst volume based on the known
burst altitude (from a TVNSP flight) is indeed the way
to go about this and is quite easy to do.

There are two things you should know:

1. There is a considerable difference in 02D and 02F
burst behaviors, both 200 gram flights. 02D was off
by about 11.5k feet, but 02F was a whopper at 19k feet
too high.

2. It's also a question of how to incorporate this
correction gracefully in LIFTWIN -- and then doing the
program rewriting.

If I had been able to know that 02F was going to end up
as a second 200 gram flight, I would have advised adding
maybe 15k feet to whatever the program said for peak
height, just because 02D was over 10k feet too high.

I have a revised LIFTWIN just about ready for release that
incorporates the ability to adjust the factory burst values
a certain amount.

Not directly related, but just an
improvement, there is a new algorithm for returning the
altitude at a given air pressure. The old procedure used
by Bill Brown was pretty good but it had numerous jumps
(discontinuities) in it. The new one is perfectly smooth.

Mark Conner recently asked me about some slightly odd results
from LIFTWIN that he noticed. They were minor but did look
strange. That's what is fixed with the new smooth function.

Hank

4622. Video clip from NSTAR capsule at GPSL 2002

I have a video clip showing the launch and the view at various altitudes at the following site:

http://68.13.112.250:14480/NSTAR02D/NSTAR02D.wmv

The clip is about 12 Mbytes and 5 minutes. This server should be able to uplink at about 128 kbits/sec, but I've been told it's not that fast at times. If you do download the movie on a broadband connection, please send me a short note with the bandwidth you got from me.

Could a difference in the initial fill account for that variation? As I recall 02D was launched very hot. Can anybody comment on that? (I wasn't on either launch.)

> 2. It's also a question of how to incorporate this
> correction gracefully in LIFTWIN -- and then doing the
> program rewriting.

Obviously I haven't looked at that end of LiftWin, but I would suspect that you have a table of manufacturer's data somewhere. The long term right answer would seem to me to be adding a second table of correction factors. This would allow tweaking the behavior based on experimental data without changing the manufacturers spec. Again, I can't judge how hard that would be given the architecture of the program. A quick fix might be to tweak the manufacturer's data table.

Bill

4624. Updated Beacon code

Date: 2002-10-09 15:09:42 UTC
From: Stephanie Steele
Topic: 4625 Message: 4625

Hi Paul,

I don't remember if I told you but I bought a SiPix camera to see if we can make it work for our flights. I contacted the mfg to see if they would sell me a schematic for the camera or if they would perform the needed mods but they are not interested and refuse to sell or otherwise provide a schematic or any technical information or mods on the camera or it's firmware. They implied that they were afraid that I was trying to perform some corporate espionage on them. They are a little paranoid I think.

Who have you been using locally to hack the digital cameras to provide external connectors for power, shutter etc. ? Are you interested in doing that with this camera? I'll donate the victim er I mean camera if you want to have the mods attempted.

I didn't know you had purchased one. I looked at it last week and
was sorely tempted, however, my mothly budget was even more
sore, so I couldn't afford it. I like the SiPix since it's so tiny. I say
we dissect that puppy. When it's in its package, you can't see the
back of it. Are there screws in the back that we can remove to
open it up? I need to see the shutter switch to determine if I can
modify it (I want to add this to my book). If it looks difficult, we
take it to Photek. I've had good sucess with them modifying
cameras.

Yes, there are screws. We also need to modify the APO somehow. I'll donate it for experimentation. I don't have time to do it myself until mid-winter.

4629. Vallivue Launch

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-10-09 18:23:17 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 4629 Message: 4629

Ed will be at the VOI meeting tonight to discuss the launch. He's excited about it. I'll bring the lesson plans. Let's get TVNSP crew to pull Ed aside to clear up any issues.

Paul

(I wasn't on either launch.)

Bill,

The above overshoots of 11.5 and 19k feet already take into account the degrees of fill as reported to this list by the responsible TVNSP member.

It isn't always easy to get an exact measure of lift before launch, but any data is better than no data with these large overshoots. The TVNSP lift measurements for both flights were probably quite accurate anyway.

Perhaps when more performance data accumulates that would be a very worthwhile idea to implement. So far there are only the two 200 gram flights by TVNSP and a report from EOSS of a big overshoot on a 300 gram balloon.

I think Mark recently mentioned a small balloon flight that he did a while ago.

> This would allow tweaking the behavior based on experimental

> data table.

The quick and very easy fix is to add on about 15,000 feet to whatever the present program says for these small balloons. It bears repeating that we all strive for accuracy in trying to predict payload landing spots, but it's not uncommon

for predictions to be 8 or more miles from actual landing spots.

As for program changes, it's not an issue of difficulty really. It's a matter of coming up with a user interface that is natural and fits the situation, and that will last for a while without needing to be rewritten.

Hank

I think it means auto power off. Camera shuts itself off
after a certain period of inactivity.

This is standard procedure for a corporation in a highly
competitive, technology intensive field. You will never
get a schematic of a current camera model as an ordinary
citizen (i.e., not a factory authorized repair facility
person).

> They implied that they were afraid that I was trying to

This is very common. Once I called a manufacturer of
meteorological instruments and inquired about a high
precision altimeter/barometer product used at airports.

I casually mentioned their radiosonde line and that I
happened by coincidence to have worked once for a company
(maybe 10 years prior) that had recently acquired a competing
radiosonde company (there are only a handful in the world).
This fellow immediately said that he shouldn't be even
speaking with me. He did keep talking, though. :)

That's just the way it is in industry.

I ordered schematics on a 5 yr. old monitor a while back and practically had to sign away my first-born. They wanted to make sure that I was using the schematics strictly for troubleshooting and repair purposes, and would not be passing them on to any competitors.

It's Builders Lighting on Milwaukee. It's located south of the
Borders bookstore and on the opposite side of the street. It's
across the street from an Italian restaurant. I believe it's on the
interesction with Rifleman.

Be sure the to the ones that end in -BL, do not use the ones that
end in -BLB.

From: verhap@occ1.sd01.k12.id.us
Topic: 4638 Message: 4638

I just had an idea about t-shirts. Would anyone be interested in making a t-shirt at the end of the launch season that looks like a rock band tour t-shirt? On the back would be printed,

TVNSP Near Space Tour

Then follows a list of flights, launch location, and altitude.

Whadda think?

Paul "Near Space Groupie" Verhage

I've put together a list of top 10 bumper stickers for one of my chapters. Unfortunately, I have 13 of them. If you get a moment, could you vote for three of them from the island? I would like to hear your opinion as to the weakest three of the ideas. I have an opinion about some of them, but would like some other opionions.

By the way, if you come up with a great one, please let me know. If I add it to my list, I'll write you in for credit.

Paul

Ten Near Space Bumper Stickers

1. Have APRS, Will Travel

2. Got Helium?

3. 100,000 Feet?
Been There, Done That

4. Conquering Near Space, One Syntax Error At A Time

5. Will Chase Balloons For Food

6. Amateur Near Space, Not Just Amateur Science, It's An Adventure

7. If I Were A Weather Balloon, I'd Be At 100,000 Feet By Now

8. 100,000 feet and Bust!

9. 0 to 100,000 Feet In 120 Minutes

10. Near Space Recovery, The Ultimate Road Rally

11. Eat, Sleep, Chase Balloons

12. I'd Rather Be Near Space Chasing
.
13. Helium, It Does A Balloon Good

I kind of like top ten lists with more than 10 items. Eccentricity is my life!

I have some ideas, especially for our group.

"Got Wilderness?"

"Got Tree?"

"Anyone seen my balloon?"

"Going, going, gone!"

"Oops!"

;-)

4645. NWS 800g balloons

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-10-10 18:27:23 UTC
From: n9xtn@cox.net
Topic: 4645 Message: 4645

Found this while doing a Google search. Haven't found anything yet regarding what the NWS overall results were.

Upper Air Balloon Test

The NWS will conduct a field test with high modulus upper air balloons for the period December 1, 1996 to March 31, 1997. A total of 13 sites will take part in the test.

Bismarck, Davenport, and Grand Junction are the Central Region offices that have been selected to participate. Sites with higher incidences of limiting angles were selected in order to get the maximum benefits of the test.

The balloons being tested are 800 gram high modulus balloons manufactured by KKS and Totex. The high modulus balloons have a tighter and tougher skin that will not elongate (remain spherical in shape) and are more resistant to tears and holes. The design of the balloon allows for a faster ascension rate with the same amount of nozzle lift as with the Kaysam 600 gram general purpose balloons currently being used. The high modulus balloons typically ascend approximately 50 meters per minute faster from the surface to 400 hPa than the general purpose balloons. The ascension rate from 400 hPa to termination is only slightly higher with the high modulus balloons.

The purpose of the test is to determine the operational differences between a general purpose and a high modulus balloon. If a high modulus balloon with an average ascension rate of 350 to 375 meters per minute is compared with a general purpose balloon that achieves the typical 275 to 300 meters per minute ascension rate the following questions are hoped to be answered:

1. What decrease in number of flights with limiting angles can be expected?
2. What increase may be realized in burst altitudes?

3. What decrease may be realized in the number of transponders used?

4. What decrease may be expected in the number of second releases and failed flights?

5. What decrease may be expected in the number of severe weather balloons used?

6. What cost savings may be realized by: decrease in balloon cost; decrease in number of transponders used; decrease in number of second releases and failed flights; and decrease in number of severe weather balloons used?

W/CR42x4 - Robert J. Bonack

Subject: [tvnsp] T-shirt Idea

I just had an idea about t-shirts. Would anyone be interested in
making a t-shirt at the end of the launch season that looks like a
rock band tour t-shirt? On the back would be printed,

TVNSP Near Space Tour

Then follows a list of flights, launch location, and altitude.

Whadda think?

Is there a complete listing of Idaho Radio Clubs? Doug, is this someting VOI keeps? I know arrl.org has a list of affliated clubs.

I think I'd like to arrange to speak to all of the Idaho clubs about TVNSP over the course of a year. I plan to start with the ARRL site. If anyone knows of a more complete list, please let me know.

Thanks,
Paul

The UofI club is down to a core of 3 or 4 people.... I'll be up there in a few weeks, and could do a presentation then if you like. But after Nov I wont have any reason to go up there anymore.... So let me know this week if you could.... and email the stuff to me if need be...

And you did the HP club last year.....

I'm taking electrical engineering classes at BSU at would be happy to investigate their club and do a presentation.....

You can take the other 27 ;) hee hee, maybe some other members rub elbows with the other clubs? 30 is alot for one guy to do.

Sounds like a plan, if you want me to swing by and pick anything up (videos/capsule whatever) just say so, i'll initiate contact with the UofI club, and invite the WSU club (And other local clubs) to the presentation as well if it's okay with you, this might get a total of 7 to 10 at the presentation.
Just to let you know, i checked out the webpages of BSU and there is no mention of a ham radio club (even on the student clubs page). I called the "student activities coordinator" and they are totally unaware of any BSU ham club. I did find a guy online (Dan 'dan@...') who says on his webpage he's a ham who went to BSU, so i emailed him.... Thats about all i can do, unless someone knows a name or contact of someone in the club at BSU (if there is one).

presentation.
> Just to let you know, i checked out the webpages of BSU and there is no mention of a ham radio club (even on the student clubs page). I called the "student activities coordinator" and they are totally unaware of any BSU ham club. I did find a guy online (Dan 'dan@...') who says on his
webpage he's a ham who went to BSU, so i emailed him.... Thats about all i can do, unless someone knows a name or contact of someone in the club at BSU (if there is one).

John, did you pick up the complete PC? That's the one we need to
sell first.

I'd be interested in helping present to the Idaho Fall's club (Eagle Rock ARC) at some point.

However, I will mention that they do not seem to be familiar with APRS over there. I was thinking about trying to get hooked up with them at some point and do some education to try and help the APRS infrastructure over that way. Last time I was over there with a tracker I managed to get out from Craters of the Moon, but that was via Harin. I heard zero, zip, nada on 144.39 while I was in IF.

I have the complete PC. It was designated for a
co-worker with Russ.

Russ, has he contacted you, he never has contacted me.
Does he still want it?

Hey gang,

How about if we try and make a coordinated effort out of approaching these clubs so that we enhance the Idaho APRS group's chances of getting these clubs to consider providing access to their repeater sites for placement of an APRS digipeater. Our group has been working on trying to make positive contact with some of these groups for the last couple of years for placement of digis and it would be to everyone's benefit if we could make these presentations serve both purposes. This is one area where NOT getting in a hurry and doing a good presentation would be prudent.

That was exactly what I had in mind. Any good starting points you can think of? Any idea on APRS history over there? It seems odd to me that there didn't seem to be any APRS activity yet NWAPRS or ??? has an IF map as an example. I did make voice contact with a ham over there a month or two ago when I was in the area and it didn't sound like he was familiar with it at all.

Surprisingly, other areas of the country don't have
APRS digirepeaters either. When we drove back to
Minnesota, I didn't hear any APRS signals through most
of North Dakota. Did in Eastern Montana. I talked to a
ham in Grand Forks, ND and he indicated they had a bad
experience with Packet Radio and everyone lost
interest in it. No one followed up to the newer
technology.

Its to bad, that area could take full advantage of the
APRS system.

4670. Re: [tvnsp] Idaho Clubs

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-10-13 14:09:54 UTC
From: Stephanie Steele
Topic: 4650 Message: 4670

What I was thinking was to make sure and coordinate with the APRS group so that one of us could go with the TVNSP rep when they do the presentation to answer questions about how they could get started with APRS. It just so happens that the three most active APRS apostles are also balloon junkies. This is a good thing. The first meeting would also be the ideal time to speak with the club leadership about placement of a digi to serve their area. The APRS group can provide technical assistance, loaner equipment, and training for clubs that are interested in getting started in APRS. As you know by now, ballooning in Idaho without the aid of APRS would be foolhardy if you ever hope to recover your equipment and strategically placed digis simply enhance that.

The biggest problem is the steep learning curve required of APRS. This makes it difficult for areas without an established Elmer to get up and going.

I wonder what the 'bad experience' was? Perhaps it caused digestive upset? ;-)

You're correct Bill, there is apparantly no one in the Idaho Falls area
that has any idea where to start. I have been communicating with a
couple of hams over there trying to get some excitement built up but no
go yet. This balloon idea could be just the catalyst to get it moving.

It isn't a matter of increasing interest, many of these groups don't have anyone to Elmer them into APRS so they don't see the need for a digipeater.

Hi,

There's been some discussion from time to time regarding how high altitude balloon beacons might or ought to conform to Part 97 FCC Rules & Regs re ham radio. As you probably know, these beacons are not unlike satellites, in that they cover a huge area of the surface at apogee -- over 60,000 square miles -- and that in the event it malfunctions, the power switch is hard to reach until recovery.

However, balloon-borne payloads have not yet been given the same regulatory consideration granted to satellites. But so long as we exercise "Good Amateur Practice" per Section 97.101(a), as defined a bit further in the appended excerpt from the ARRL Letter Vol 21 #40, I don't believe that such consideration is necessary or appropriate.

True, each beacon could be provided with a command receiver, but then we'd be banging our heads on the FAR-101 exempt weight limits more often. And shutting down a tracking beacon to avoid QRMing a distant simplex net also may impair our ability to pass position reports to the FAA, thus would risking >far< greater harm. Not to mention risking loss of our own or, worse, a student payload.

Fortunately, our beacons are QRPP for the most part, and our flights last no longer than one could reasonably expect to notify the ham whose TNC got a stuck key on the APRS backbone and to get him to shut it down. Further, we are careful in chosing our downlink freqs to avoid repeater inputs, satellite, prop beacon and DX subbands.

So long as we continue with this level of careful consideration, I believe that we in the high altitude balloon community are indeed conforming to "Good Amateur Practice". Let's not get sloppy.

==>"GOOD AMATEUR PRACTICE" MEANS NEVER HAVING TO SAY YOU'RE SORRY

FCC Special Counsel Riley Hollingsworth has endorsed a list of several points that he feels help to define the concept of "good amateur practice." Section 97.101(a) of the Amateur Radio Service rules refers to
"good engineering and good amateur practice"--considered to refer to maintaining the highest standards of engineering and on-the-air comportment. But the rule lacks specifics.

"Good amateur practice is a hard thing to define," Hollingsworth conceded.
"I'd have to say it's operating with the realization that frequencies are
shared, that there's going to be occasional interference and that's no reason to become hateful and paranoid."

Hollingsworth says amateurs have to realize that more people than ever are
listening in, especially since September 11, 2001, and that amateurs always need to remember that "our rights end where another person's begin."

A Michigan Amateur Radio club has been credited with distributing a list of "Riley-isms" culled from Hollingsworth's various talks at conventions and hamfests and club meetings around the US. Hollingsworth--who verified
that he had been cited accurately--says his various comments represent an
effort to flesh out what "good amateur practice" consists of for considerate the Amateur Radio operator. According to Hollingsworth, good amateur practice means:

* giving a little ground--even if you have a right not to--in order to help preserve Amateur Radio and not cause it to get a bad name or hasten the day when it becomes obsolete.

* respecting band plans, because they make it possible for every mode to have a chance.

* being aware that we all love Amateur Radio, and there's no need to damage or disgrace it just to save face.

* keeping personal conflicts off the air. Settle your arguments on the telephone, the Internet or in person. Just keep them off the air.

* cutting a net or a contester a break, even if you don't have to and even
if you have no interest whatsoever in nets or contesting.

* realizing that every right carries responsibilities, and just because you may have a right to do certain things doesn't mean it's right to do them in every circumstance.

* you don't "own" or get preference to use any frequency.

* not operating so that whoever hears you becomes sorry they ever got into
(or tuned in on) Amateur Radio in the first place.

Hollingsworth notes that the list "doesn't touch on a lot of other technical issues, such as using 1500 W when your signal report received is
40 over 9." Good amateur practice, he said, "just means a lot of things that can't always be quantified."--thanks to Riley Hollingsworth

From: Mark Conner
Topic: 4678 Message: 4678

Just got off the phone with Kaysam - nice folks to deal with.
The following sizes and prices are the ones they generally keep
in stock (does not include shipping):

1500g 64
1200g 48
600g 35
350g 30

They also mentioned they do individual inspection before
shipment, so it's a few days between placing the order and when
it goes out the door - keep that in mind if you have a
last-minute order. I got one each of the four sizes listed -
we'll see how they do next year.

To: Jeff Melanson <kd7inn@...>

Don't forget, we have a launch this Saturday. We'll be
sending up
two of my capsules. The total weight will be 12 pounds.
Add one
pound for the parachute. I've got a Kaysam 1500 gram
balloon.
With two or three pounds positive lift, I estimate we'll
make
between 90,000 and 95,000 feet. Climb rate will be around
1000
f/m with a descent rate around 1200 f/m. Does anyone want
to
confirm these numbers?

John the Younger, have you been able to contact Ed?

Vallivue will be tracking the flight and be on the repeater,
so be
sure to say high. I should have a message for them over
APRS.

If we can launch a little late, that would probably be good
for the
school, but a safe launch comes first.

As for the next launch, is there enough interest to launch
the first
weekend of November? That would be my sixth anniversary of
near
space launches. I brought up launching two small tracking
capsules before, Jeff's and mine. If we do that with 300
gram
balloons, I'd like to carry up a beacon. We could let clubs
DF the
beacon as part of of a competition. Perhaps it's too short
of a
notice for that. In that case I'd be interested in a night
launch (very
early morning) to record sunrise. Jeff, can we use your
camcorder

for that? Stephanie, would you be interested in sending your
capsule up a second time? Sky and Telescope says they'll publish the photo of near space sunrise if we take it.

So how does three more launches this year sound?

Mike, can you get the tanks gauged? I want to make sure we have
3600 PSI of helium left. I'll talk to Sheehans about the cost of a
regulator that we could use to measure the pressure in a tank.

I've got four club meetings this week and gym on Monday, Wednesday, and Friday. If anything needs to be done in the evening, tonight will be my only free night. Contact me ASAP.
Everyone should have my cell phone number.

Paul

Dave,
It probably wouldn't hurt to have a digi at Pine, but I'm wondering if we might have some coverage redundancy with the digis on Cinabar and Mt. Harrison, but don't let that discourage you by any means. Also, if you're going to be running a KPC3+ on your station to be set up by the 19th, you can use that as a digi and still operate other APRS functions.

Tim, N7UBO

4684. Oct 19 Prediction

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-10-15 01:29:58 UTC
From: John Knapp
Topic: 4681 Message: 4684

I ran a prediction this evening for Saturday's flight.
It is changing from the one I ran last night.

I have been using the following:

Ascent rate: 1000 f/m
Decent rate: 1200 f/m
Burst height: 90,000 ft.

The results I have:

Flight time: 122 minutes
Bearing: 148 degrees
Range: 44 miles.

I do not the coordinates for Vallivue High School. Can
someone supply them so we can do some serious plotting
on SA?

Also, am I using the right values for the flight?

Hi Dave at Pine,

We haven't met yet but I am the local "Joannie digiseed". I am always on the lookout for good digi locations as we try and enhance the APRS network. Can you tell me more about your site. What altitude is it and what is the power source? What direct coverage area would you expect from there. I know that your area is somewhat shaded from the existing digis based upon the results from the last balloon chase but I am unsure what adding a digi near Pine would add to the system. Might at the very least be a good spot for a relay digi. Let me know. I have equipment to lend.

I don't have the position for Vallivue, but the numbers look right and
very good.

Update, you capsule weight is closer to 10 pounds. Add an
additional 1/2 pound for the glider and 1 pound for the parachute.

These predictions depend on so many variables that
it must be remembered they offer just a rough guess,
especially this many days ahead of time.

Vallivue is on Homedale at the junction with
Montana.

The coordinates good to a few hundred feet are:

43 degrees 37.2 minutes north
116 degrees 40.8 minutes west

Date: 2002-10-16 02:28:23 UTC
From: K7JPS - John
Topic: 4691 Message: 4691

For those in the area that attend the Snake River ARC meeting. They meet the 3rd Wednesday of each month. The newest meeting location is the Shanghai Restaurant, 332 Caldwell Blvd, Nampa, ID. This is at the intersection of Caldwell Blvd. and Orchard Rd. across the street from the Chevron gas station and the old Ed Mark dealership about 1/2 mile west of Fred Meyers.

From: Jeff Melanson
Topic: 4693 Message: 4693

John,

I called Kaymont to check on the 300 gram balloon you wanted. Paul claims it's on the way. They substituted the 300 for a 350 because they are out of stock on the 300's.

Okay. We need to reserve the Jade Garden. I haven't heard from
Ed in couple of days now. Dr. Atkinson from U of I was told to
expect us there. I haven't heard from him in a ciouple of weeks, so
I don't know if he's still planning to attend.

Attachments: 2 described; binary payloads are missing from this source WARC

Here's the configuration for the TV02G capsule. Tonight I need to glue the labels to the glider and tie a loop in it's tail, except for that, everything else is complete. I ran a test program last night and cycled through the experiments. I also downloaded the flight code into the capsules, and observed the capsules to make sure the old test code wasn't still inside. The batteries in the main capsule are new, the batteries in the backup are on their second flight, but all read higher than nominal voltage. I'll bring both capsules to tonight's meeting.

The MRF shows we will be in the northern boundary of a high pressure system. Winds inside a high tend to be light and disorganized. The jetstream is way off to our east.

At least up to 30,000 feet, the balloon should drift slowly.

Paul

I thought someone may have reserved the Jade, thanks.

And thanks for getting the tanks gauged. Imagine our
embarrassment when we have just enough He to give the balloon
zero pounds of lift.

That date should work for me. I'll take either professional leave or
person leave. I'll pass the word onto TVNSP crew about the
possibility of them doing the launch.

How about it folks, how many can go to Moscow to help out with a
launch in April? I'll also look into getting help from Washington
state.

We don't know if we can launch from Vallivue, yet. Ed was going
to look into that. Don't anyone forget that we need to ask Ed
tonight if he got permission.

4715. Vallivue Launch

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-10-16 20:59:04 UTC
From: Mike Garske
Topic: 4629 Message: 4715

Paul,

I thought I saw an email from about a week ago from Ed saying we could launch from Vallivue......I will wade through the last emails I have. Is there a meeting in Emmett tonight?

Paul,
I notice that you have a CWID programmed into the MIM module in Capsule two. It's my humble opinion that a CW ID beacon really has no place on a frequency that is being used for data transmissions, plus it uses as much air time as probably 5 or 6 packets or more, basically wasting the bandwidth during that time. Granted, it's set to only transmit once every five minutes but it is sending redundant information because of the beacon text that's set to transmit every two minutes. If anyone disagrees with me, I've prepped my asbestos ear muffs.

Subject: [tvnsp] TV02G Configuration

Here's the configuration for the TV02G capsule. Tonight I need to glue the labels to the glider and tie a loop in it's tail, except for that, everything else is complete. I ran a test program last night and cycled through the experiments. I also downloaded the flight code into the capsules, and observed the capsules to make sure the old test code wasn't still inside. The batteries in the main capsule are new, the batteries in the backup are on their second flight, but all read higher than nominal voltage. I'll bring both capsules to tonight's meeting.

It's been many years since I've been to Moscow, so it's about time to do it again. I should be able to plan for the time off, and I think it would be ALOT of fun to launch from there and chase from that area, especially keeping in mind that there are not many, if any, APRS digis in the area. So put me down for a YES......

Paul,

I thought I saw an email from about a week ago from Ed saying we could
launch from Vallivue......I will wade through the last emails I have. Is
there a meeting in Emmett tonight?

It's at the only pizza place in Emmett. Other than that, I was going
to search around for it myself. The meeting begins at 7:00 PM. I
plan to have dinner before I get there.

The weather is predicted to be very nice on Saturday. Form the graphic MRF, there is still a surface high pressure system but the upper level high is "falling a part" (I hope that's the proper way to say that - Mark?). However, the winds aloft are still predicted to be light and out of the west.

I'll run a prediction later, but I don't imagine the range is going to change much. The bearing is what looks like is going to change.

We have permission to launch from the high school. Since the sun rises around 8:00 AM, I'd like to launch around then. I need to let students know by Friday if we can launch from Vallivue at 8:00 AM. So please email your input.

Paul

I am using the ETA model (40km over US), location at
BOI, and date/time of Oct. 19, 2002 at 15UTC (+51
hrs). I have the following results:

Time: 121 minutes
Bearing: 118 degrees
Range: 38.7 miles.

I am using a burst altitude of 90,000 ft, 1000f/m
ascent and 1200f/m descent.

The time and location sounds good for me Paul
I ran a prediction awhile ago and got:

Time 122 min.
Bearing 117 deg.
Range 41 mi.

Basically following I-84 SE near Mayfield again.

>>> verhap@... 10/17/02 10:12AM >>>

I'm not sure of Paul's logic behind it, but a CW ID from the primary transmitter would be very helpful if you need to RDF the capsule's primary. If you were on a sub-standard frequency, then I think decreasing the time between CWID transmits could be helpful, but I tend to agree with you that it shouldn't be on 144.39.

Paul,
I notice that you have a CWID programmed into the MIM module in Capsule two. It's my humble opinion that a CW ID beacon really has no place on a frequency that is being used for data transmissions, plus it uses as much air time as probably 5 or 6 packets or more, basically wasting the bandwidth during that time. Granted, it's set to only transmit once every five minutes, but it is sending redundant information because of the beacon text that's set to transmit every two minutes. If anyone disagrees with me, I've prepped my asbestos ear muffs.

Tim, N7UBO

Here's the configuration for the TV02G capsule. Tonight I need to
glue the labels to the glider and tie a loop in it's tail, except for that,
everything else is complete. I ran a test program last night and
cycled through the experiments. I also downloaded the flight code
into the capsules, and observed the capsules to make sure the old
test code wasn't still inside. The batteries in the main capsule are
new, the batteries in the backup are on their second flight, but all
read higher than nominal voltage. I'll bring both capsules to
tonight's meeting.

Paul

Group,

Looks like we have a total of 2500 psi out of a possible 6000psi....in other words we have about 1.25 bottles of Helium. I vote we pick up one more bottle for the flight. Let me know, I can pick it up anytime. I am willing to kick in $20 towards the cause....what a guy! :)

It's a feature in the MIM (the Tiny Trak also). It's just another way
to find the capsule if the GPS goes bad. I imagine it's tough to DF
a packet burst. The CW ID takes several seconds. there's no way
to have the MIM or TT use a second radio. I know of no way to get
the HT to use a seperate frequency for APRS and CW.

Paul

> I'm not sure of Paul's logic behind it, but a CW ID from the primary transmitter would be very helpful if you need to RDF the capsule's primary. If you were on a sub-standard frequency, then I think decreasing the time between CWID transmits could be helpful, but I tend to agree with you that

From: verhap@occ1.sd01.k12.id.us
Topic: 4734 Message: 4734

Looks like a good flight. Since I haven't heard anything, I'd like to try to launch from Vallivue (Friday night will know for sure). So when we do predictions, let's see where a Vallivue launch would land.

Paul

> I am using the ETA model (40km over US), location at BOI, and date/time of Oct. 19, 2002 at 15UTC (+51 hrs). I have the following results:

>to have the MIM or TT use a second radio. I know of no way to get
>the HT to use a seperate frequency for APRS and CW.

Can I suggest that you only do the CWID if the GPS data is indicating that it's invalid? It's pretty easy to tell since I believe your flight control computer is looking at the NMEA data anyway.

That way you have the best of both worlds. You don't tie up the APRS frequency for any length of time and you have the CWID when you need it.

It's too late for this flight but I'd also include a reset circuit. I haven't found any plans (though it shouldn't be tough to design) but I know PCSat just uses a simple "if I haven't seen PTT in the last 90 seconds I reset" as one reset circuit. I haven't tried it yet, but I did run it past somebody that designs electronics all the time. He confirmed that a simple compare circuit on the PTT should be almost unnoticeable and give you good isolation. (PTT grounds for talk - note that where you tap into it probably depends on where you wired the resistor and capacitor that most HT interfaces take)

Bill

4736. ETA Predictions 17 Oct 18z

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-10-18 03:19:22 UTC
From: K7JPS - John
Topic: 4736 Message: 4736

I just ran predictions using the ETA model at +42 Hours (19 Oct 12Z.) I had to modify the data to include the current winds (18 Oct 0z) above 20633m (67694').

My results were:

Bearing: 107 degrees
Range: 44 miles
Time: 120 minutes

If launched from Vallivue HS it would touch down east of Mayfield (mountains?)
If launched from Bully Creek it would touch down south of Emmett (mountains?)
If launched from Succor Creek it would touch down between Oreana and Grandview (Snake River?)
If launched from Murphy it would touch down east of Mountain Home AFB (need I say more?)

The directions were posted in an earlier reply to Paul. Oh, and by the way, Emmett DOES have more than one pizza place.....Pizza Hut, Hometown Pizza, and Pizza Factory.....

Tim

It's at the only pizza place in Emmett. Other than that, I was going to search around for it myself. The meeting begins at 7:00 PM. I plan to have dinner before I get there.

South of Emmett would probably be a preferred recovery area. The hills are much gentler than other areas, as witnessed by those that recovered a prior payload in the area between Emmett and Middleton.

I guess technically I'm SE of Emmett, but if you guys want to land it in my field go ahead. <grin>

OTOH if we float it past Mountain Home AFB we don't have to worry about a cutdown device. The USAF will take care of that for us... (Just kidding!)

Bill

p.s. I'm available for over the air support in the morning till roughly 10:00. We've got soccer games after that. Not sure yet if I'll make the prep meeting.

This is the MIM flight computer, not my CC/PS.

Did I just imagine it, or did I read some place that CW could be
sent over all bands?

Paul

4741. MIM Beacon, was TV02G Configuration

I guess the answer to that is, yes, but just because it's allowed,
doesn't mean you should do it.

Anyhow, this is a MIM, I can't change frequencies or shut off the
feature until there's a problem on the flight. It's currently set for five
minute intervals and takes a couple of seconds. Would it be less
pesky if I change that rate to once every 10 minutes?

In future flights the CC/PS will operate a CW beacon. for tjhos
flights, what's a good frequency?

4742. TV02G Prediction, 18 Oct, 7:42 AM

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-10-18 14:49:58 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 4742 Message: 4742

I just ran a prediction using the AVN model for 9:00 AM our time. The predicted landing location is at range 39.7 miles and bearing 109 degrees. Not too far from John's earlier prediction. Perhaps the variation in bearings will now settle down. So it sounds like Bully Creek.

If the burst altitude is 5,000 feet higher, it moves the landing site 2 miles further down range. The bearing increases by one degree.

If burst is 5,000 feet lower, the range is reduced by two miles and the bearing decreases by about 1.5 degrees.

I imagine (without looking at a map), that the change in bearing is not significant. When we choose a launch site, we want to look at the terrain in a four mile ellipse, centered on the predicted landing site.

Paul

4743. Thermochron

Jeff, can I use your T-chron on this flight? I've sewn a new style MLI blanket for the second module and would like to compare temperatures in both battery compartments.

Paul

4744. TV02G prediction, pt 2

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-10-18 15:05:00 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 4744 Message: 4744

I made a mistake, I used the ETA model on the first prediction. On this prediction I used the AVN model.

The range is 37 miles and bearing 110 degrees. The two models agree well.

Paul

Only problem is that a lot of that land is private and
getting access may me a major problem. While a good
landing area, I would prefer somewhere else because of
the land issues.

Sending CW on the APRS frequency is not recommended but for a short duration balloon flight should not cause too much heartburn. It just serves to tie up the frequency and prevent properly formatted packets from being moved. I would suggest if you just have to send CW please send it no more often than once every 10 minutes. There is no requirement to send CW on any band unless you are operating CW in the CW portion of a band.. The only ID requirement is to ID once every 10 minutes and at the end of your contact. APRS takes care of this by sending the callsign with each packet.

As you run your predictions you might consider these launch points if
you need to move the landing zone as indicated.

To move the landing east look at:

Cairo School 43 59.267 -117.00.636

To move the landing south and east look at:

Nyssa School 43 52.597 -117.00.030

These coordinates are estimates (should be good enough). I have the
actual coordinates in the car if anyone wants them.

4758. Boy Scout Invitation 10-29-02 Noon Kiwanis Curtis Park near Caldwell ID

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-10-19 03:12:27 UTC
From: Russ Dunn
Topic: 4758 Message: 4758

Three sets of Boy Scout leaders are at a training camp tonight near Caldwell. They have extended an invitation to spotlight ham radio tomorrow (Saturday) at noon. Their training schedule is completely full, but this will be during lunch and should work out well. By then, we should have some very recent balloon data.

Any volunteers to bring TVNSP stuff and showcase it? I have an inverter and a laptop, but not all the APRS software. It will be emergency power exclusively. It's a rural camp.

These are Boise and Meridian troops. I've identified one ham prospect already with whom I will follow up tomorrow. How will the kids learn radio if their teachers aren't involved? Must start somewhere.

I'll be on 147.24 mobile as it will take me 20 minutes to get there (11:40 AM and forward).

Subject: [tvnsp] TV02G Prediction, 18 Oct, 7:42 AM

I just ran a prediction using the AVN model for 9:00 AM our time.
The predicted landing location is at range 39.7 miles and bearing
109 degrees. Not too far from John's earlier prediction. Perhaps
the variation in bearings will now settle down. So it sounds like
Bully Creek.

If the burst altitude is 5,000 feet higher, it moves the landing site 2
miles further down range. The bearing increases by one degree.

If burst is 5,000 feet lower, the range is reduced by two miles and
the bearing decreases by about 1.5 degrees.

I imagine (without looking at a map), that the change in bearing is
not significant. When we choose a launch site, we want to look at
the terrain in a four mile ellipse, centered on the predicted landing
site.

Tim,

The launch location has been changed to Bully Creek Campground near Vale Oregon at 8:00am. We will be meeting at the Ontario Walmart tomorrow morning at 6:00am. Looks to be a landing South of Emmett we are shooting for.

4762. Latest Prediction- Using 19 Oct, 00Z Winds

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-10-19 04:00:58 UTC
From: Mike Garske
Topic: 4762 Message: 4762

Using the latest winds, 95,000 burst altitude, 1200 Ascent/Decent I have the following:

31.3 Miles
Bearing 112.9 degrees
112 minute flight duration.

Anyone concur?

Also, can someone post the Bully Creek Campground GPS Location?

Mike KC7DPD

www.tvnsp.org

4763. RE: [tvnsp] Latest Prediction- Using 19 Oct, 00Z Winds

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-10-19 04:15:24 UTC
From: K7JPS - John
Topic: 4762 Message: 4763

I came up with 32.0 miles
116.6 degrees
119 minutes

using 1000/1200 burst at 90,000 so there doesn't appear to be a big difference with the accent rate or altitude change.

Bully Creek

N 44.0241 W 117.4008 Alt 2520

Using a modified ETA model for Bully Creek at 18 Oct 18Z +20 hours the data changed to:

40. 3 miles
96.6 degrees
120 minutes

This would put us down northwest of Emmett about 5 miles, but it is a whole lot better then bursting over Barber Park in Boise and landing in near Lucky Peak Reservoir

Hi all,

I used 95,000 ft burst.

With current BOI data I get:
31 miles
113 degrees

With the ETA Model for 03Z data I get

33 miles
109 degrees.

This places the landing around exit 13.

I am going to build a section on the Website for classifieds in which donations can be advertised for sale. The money will be sent to VOI, but will be placed in the TVNSP account. If you have anything you would like to donate for our good cause, send an ad to me, exactly as you would like it to be placed and it will be put on the website at the soonest possible time. I would also like to create a Humor website for those who feel they have a laugh or two to share, please do so! And also, we are trying to come up with ways to make money. If you have any ideas, please share those as well. Thanks for your eyes and ears...

4779. 02G landing spot and local topography

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-10-19 21:22:04 UTC
From: Hank
Topic: 4779 Message: 4779

02G appears to have landed near Dyes Gulch just east of the Sweet-Ola Highway on the slope of Squaw Butte.

It is about 1.4 miles east of the road and about 700 feet above the road elevation; the valley road is around 2600 feet.

This could have been much worse since 02G just missed the very high ground of the butte at 5900 feet. The landing spot can be reached by both a trail and a powerline from the road.

Topo map graphics being prepared.

Hank

WEST of the road and on the east slope of the butte.

4790. Actual 02G landing compared to predictions

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-10-20 02:07:15 UTC
From: Hank
Topic: 4790 Message: 4790

It's interesting to see all the late Friday predictions
and compare them to what really happened.

Here are the posted predictions:

31.3 miles
112.9 degrees

32
116.6

40.3
96.6

32.3
116.3

31
113

33
109

The actual course was approximately 52 miles at
91 degrees.

Had this course been followed with a launch from Vallivue HS
(it would have been similar but not identical), the payload
would have landed about 5 miles east of Grape Mountain which
in turn is just east of Arrow Rock Reservoir in the Boise
National Forest. This is the Little Rattlesnake Creek area
with elevations ranging from 4500 to 6000 feet.

Hank

Was this difference due to weather predictions not matching
the actual weather conditions at launch or due to balloon
performance being different that expected or both?

Jeff,

I haven't gone over everything in detail, but there is both
a weather gap and a balloon gap. The balloon rose a little
higher than the figures I saw being used Friday
(90k and 95k feet) and might have also climbed a bit more
slowly, both of which facts would have caused a longer
track.

The angle was more north than predicted by a good amount,
and that was no doubt due to the winds being more southerly.

I feel that these predicted landing spots need to be
surrounded by at least a 15 mile diameter circle, even
better a 20 mile circle to really capture all the terrain
into which the payload may eventually fall.

Hank

Hank,

I also noticed that the balloon appeared to flatten out as
it rose upward. Much flatter that Kaysam balloons. I note
this because I would think that this flatter shape must
affect the ascent rate. Something to think about.

Did someone get a picture of it as it was rising?

A 20 mile diameter circle is a 10 mile radius. Looking at
the predictions verses the landing spot we exceeded that.

When we ran the predictions from Valley View High School the
landing spot put us near high voltage power lines so we
moved the launch to be safe. Hmmm... We ended up near
another set!

Jeff

4799. RE: [tvnsp] TV02G Flight Statistics.

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-10-20 03:34:46 UTC
From: K7JPS - John
Topic: 4791 Message: 4799

Here are the stats that were reported at launch:

Lat: 44.02434
Lon: -117.40090
Alt: 2550'
Dry Bulb: 41 deg F
Wet Bulb: 34 deg F
Launch time: 19 Oct 02 14:53:32 UTC (8:53:32 MDT)

Payloads 10.6 lb
Recovery system 1.0 lb

Balloon Nozzle Lift 16.3 lb

I don't have a flight log, but to calculate the ascent speed I need the burst altitude and time and find the difference with launch altitude and time. The closest we can get for decent rate is to calculate the change in the last two reported altitude packets.

The serial numbers and locations of the thermochrons was:
SN 01E4F - Galileo II, exterior of servo battery box
SN 1216D - Copernicus II, interior of unused battery box

Subject: [tvnsp] TV02G Flight Statistics.

TVNSP,

We need to get the statistics posted for all to study. Hank needs the information so he can study the balloon performance.

John the Younger,

What was the Nozzle Lift that you recorded, and other vitals such as payload weight.

We also need ascent speed/descent speed, etc.

Jeff

From: Zack Clobes
Topic: 4790 Message: 4800

I think I've flown and watched enough flights now that I can safely say that using the current methods, there is no accurate way to consistently predict a landing point within a couple of miles. When the winds are stable, and you actually get the correct amount of He in a balloon, yes, the prediction is within a mile or two, but how often does that happen? It's happened once for us...

I think that at least part of the answer is right under your nose - the cutdown device. You guys have said it yourselves, you need to be able to prematurely terminate an ascent in the case of underinflation, over altitude, excessive winds, (tree limbs), etc. However, I think that is only half of the battle - the other half is knowing what is happening in real time.

By that I mean that you need to be running predictions constantly throughout the ascent and descent to account for variations and errors in the prediction as well as ascent rates that are outside of the norm. I think that Balloon Track is capable of doing such calculations, but it would take a lot of hand work since I think that we should be taking the recorded wind speeds that the GPS is reporting and build them into the winds aloft data. By using actual winds as well as constantly updating the starting lat/lon/alt parameters, you could fake Balloon Track into running predictions throughout the ascent. Descent gets a little more tricky with this software.

Personally, I've been working the past couple of months on incorporating the prediction algorithms into our tracking software so I have an up-to-the-second prediction throughout the flight. So far it's not even to beta code, but initial tests are very encouraging. I was able to predict Mark's last balloon down to within a mile or so of touchdown. Hopefully it will be in beta mode by next flying season.

I believe that live predictions, coupled with a remotely controllable cutdown device would give balloon pilots the capability to forecast landing spots continually throughout the flight and activate a cutdown device in the event that an actual landing spot would put the capsule or the inhabitants into harms way.

I agree on the cutdown device 100% Zack.

By that I mean that you need to be running predictions constantly

We have been talking about this feature in Balloon Track,but no one
has
had time to work with the feature. Are you talking about the 'Packet
Data"
tab in Balloon Track? I was wondering if anyone has actually used it.

Look forward to seeing your work on this. This would be another great
tool
for the balloon groups.

I think you have all the right ideas from what i have observed chasing
balloons.

Predictions are ok,but real time data is better. And a bail out system
is
always a good idea. Only thing better that i can think of is remote
controlling the
direction of flight on descent with a para foil type chute. Minds in
our group have been
toying with this idea.

4802. Atmospheric quirk appears to explain inaccurate 02G predictions

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-10-20 18:45:14 UTC
From: Hank
Topic: 4802 Message: 4802

I always go over the actual vs. predicted performance to see where the errors came from with the view of maybe minimizing those errors on subsequent flights.

It's pretty much the same thing every time where a combination of small wind errors (either predicted winds or actual soundings) and the balloon burst height error explain any discrepancy.

In the case of 02G there is a very interesting effect which may well have played an unusually significant part. Normally the fact that the predicted wind models' data do not go much higher than 65,000 feet is not a large detriment since the winds above jetstream level (~ 35k feet) usually diminish significantly in speed.

This was definitely not the situation yesterday over Idaho nor is it today. The winds Saturday at 100k feet were at 70 mph and were climbing even higher a few thousand feet up!

Using the full Boise sounding for Saturday and the actual burst height of 103k feet, BT gives a range of 52 miles and bearing of 96 degrees (actual 52 miles and 91 degrees). So this is a heck of a lot better and shows that a *complete* wind data set up to 103k feet was necessary to describe 02G's behavior.

Recall that the late Friday predictions clustered around 31 miles and 113 degrees, except for one:

Using a modified ETA model for Bully Creek at
18 Oct 18Z +20 hours the data changed to:

40. 3 miles
96.6 degrees
120 minutes

John the younger
K7JPS

My guess is that John modified the ETA to include the upper winds actually measured on Friday for Boise above 65k feet and spliced them onto the incomplete ETA Saturday forecast winds for a composite. All John was missing was the higher than expected 103k burst to lengthen the range and score a bullseye with his prediction.

Hank

4803. Re: [tvnsp] Atmospheric quirk appears to explain inaccurate 02G predictions

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-10-20 19:12:30 UTC
From: Mark Conner
Topic: 4802 Message: 4803

In situations where strong winds exist above 60kft, I patch a current sounding for data >60kft onto a forecast below 60kft. Even when model data is available above 60kft, I find it to be of questionable value.

This approach has to be used with caution, however. While in mid-summer and mid-winter the stratosphere is slow (takes days) to change, there is a transition period in the spring and fall where the wind can change 180 degrees back and forth in a day or two. This plays havoc with making accurate predictions if the balloon spends a lot of time above 60kft.

Generally, I limit making flight profile changes to the avoiding unfavorable landing areas that are more than about a square mile. During the last NSTAR launch, our range of likely ascent rates and burst altitudes clustered the landings within a couple of miles of Red Oak, IA (built-up area about a square mile). Until the wind forecast changed, I considered a balloon size and ascent rate change to push the landing a more comfortable distance away. But for smaller towns or targets, I don't usually bother as there are too many uncontrollable variables that would push the landing left/right/far/near the quarter-mile needed to avoid (or cause) the problem, and the overall area has so many little targets you can't plan to set down in an area clear of them.

Regarding:
>to have the MIM or TT use a second radio. I know
>of no way to get
>the HT to use a seperate frequency for APRS and
>CW.
>
>Paul

>>> my thought on this is to use a radio such as a yaesu VX1 which can be programmed or 'cloned' presumably by serial input. Is there a limitation on how many times the radio could be reprogrammed ? For a lot of EEPROMs it's in the tens of thousands of re-program cycles, compatible with near-space flight activities. The idea is to "just" set up your payload electronics to program the radio for the desired frequency before it transmits. Ok, I'll admit this is quite a bit beyond my ham-handed abilities now, but exploring this concept is somewhere way down on my to do list. I have heard that the VX1 'cloning' format is proprietary, but it seems that somewhere out there there must be an HT that has open source programming. Now all we need is a 'super-ham' to dig into this project. I'm sure the AMSAT crowd would be interested in this capability, too.

4805. Re: [tvnsp] Atmospheric quirk appears to explain inaccurate 02G predictions

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-10-20 22:32:15 UTC
From: John Knapp
Topic: 4802 Message: 4805

One of the things I noticed during the past week was the change during the week for the predictions for Saturday. This was telling me the air mass above us was getting unstable, a thought which was echoed one night on the local weather news. The weather guy indicated the high pressure dome over us was breaking down. Every day I did a prediction, the wind direction slowly shifted to the north and the range from balloon track was a little longer. On Friday night we noticed the winds aloft kept increasing with height, not decreasing as they normally do.

Apparently on Saturday morning the change became more severe. I am glad we decided at the last moment to launch from Bully Creek. If we had gone from Vallivue High School, we could have had some real issues.

The type of terrain we have here does not help with the prediction. But if we had realized the balloon would burst higher than anticipated then we would have done things a little different. That makes two launches in a row where we have deliberately overfilled balloons and still have them burst higher than anticipated. Luckily, this flight landed in a good retrevial terrain.

My 2 cents worth.

> >>> my thought on this is to use a radio such as a
>yaesu VX1 which can be programmed or 'cloned'
>presumably by serial input.

I don't have a VX1, but I presume it programs in much the same way as the FT50 since the same programming software works for both as I recall. Unfortunately, that radio (and the other Yaesu's I'm familiar with) require you to manually put the radio into cloning mode.

The only radios that I'm aware of that support external software control of their settings are the Kenwoods. I don't know, but I suspect that it's only the APRS capable radios that support that and it may only be the D700 mobile.

While you could hack button presses on another radio to get it to a given frequency or memory it's pretty tough to guarantee that you wound up where you think you did.

Could have been worse?!?!

Usually people say, "congratulations on another sucessful flight".

Even my rabbits said congrats on the flight.

By the way, the butte is Squaw Butte. There are several radio towers on it. It's got with roads to the top.

> the last two reported altitude packets.

I haven't completed work on organizing the log, but right now it
looks like at ascent speed speed was 1000 ft/min until the last 20
to 30 minutes, when it rose to 1200 ft/min.

Using an average of 1050 to 1100 ft/min should be about right.

Everyone bring a diskette to launch and we'll get you a copy of the
log at lunch. Two things are slowing my log crunching down. One,
I'm writing directions about how to process an APRS log for my
book as I go along (I'll email those notes to the list, probably
tomorrow). Second, I'm trying to finish up an article for Artemis
magazine (I plan to email a copy to the group today, if teaching
doesn't get in the way).

> to get to the next routine.

I powered up the capsule last night and it seemed to operate
properly. I want to look at my altitude routines and see if the
capsule got caught in a descent loop. Initially the capsule started
a countdown (the T-10 text). Later it rotated the camera down and
started taking photos (which is what it does on descent). It never
sent data to the TNC, which is why the 4th LT buffer was never
updated.

> I also have the chute that I need to get back to you before the next launch.

I'd like to add that only one person be net control. I only want one
person giving us directions. It's fine to have several people working
together on this, but one person needs to be the spokeperson.

None of the graphics sent out (except for Hank's map) are imagine for me to llok at. I see just a small red envelope.

Also, who has the highest altitude recorded? Can you send the GPS sentence? The APRS log I have says the highest altitude was 100,002 feet.

What altitude do I write on the patches and business cards? By the way, we'll need a couple of GPS sentences to send to Ralph if we want to apply for an altitude record.

Paul

Could have been worse?!?!

Usually people say, "congratulations on another sucessful flight".

Even my rabbits said congrats on the flight.

By the way, the butte is Squaw Butte. There are several radio towers on it. It's got with roads to the top.

Paul,

The context to the "much worse" comment was that the immediate
prior message from Doug was as follows:

>Well, looks like they missed the trees, but by the
>maps I have sure hope they packed a mountain goat!

>Doug

It's just us in the peanut gallery having a little fun.

> By the way, the butte is Squaw Butte.

As was already noted on list Saturday.

> >
> > Jeff

Paul,

This has already been answered on list Saturday. Yes,
the weight includes the ring.

What I'd like you to do is to ask Kaysam for the burst
height for the 1500 gram since I don't have that
figure in LIFTWIN. I can interpolate a figure for it
from the Kaysam models I already have, plus use the
02G actual performance, but I'd also like to know what
Kaysam's number is.

I'd also like to know how the burst figures of 90k feet
and 95k feet being quoted on this list last week were
obtained if someone could explain that.

Hank

Justin has a copies from my camera. Havent had time to
review,sort and fix my pictures yet. Better half expects me to catch up on honey do's after play time. Go figure ;-(
Justin let me know if you send yours in so we don't double up on Mike and Andrea.

>>> kc7dpd@... 10/21/02 12:02AM >>>

To those who have sent photos to be posted to the page, I have been out of order for awhile and am now ready to get those pics up. Please remind me if you have sent something that didn't get put aside. I think Randy had sent some. (Our puter crashed just after you sent those pics and we had to reformat.) I know Justin did. (I have yours, for sure.)
Anybody else who sent some and want them posted, get back with me, please. Thank you.

Red shows the ascent phase. The last red dot is the highest
altitude.

There is a gap right after burst that I'll fill in later,
but the wavy path is interesting to see.

I think that wavy path was confusing our spotters at home.
I also noticed the "S" shape on my laptop during chase.
It almost made us want to take a northern route too early
for interception. The extra altitude by this balloon again
caused minor problems. We still had a good landing zone cushion.

This is a new pattern for us i believe.
Be interesting to see the experts explanation
of wind patterns here.

Thanks Hank

regards

Randy Farley

Just for your info, although it's lower than Stephanie's,
this is the highest igated:

KD4STH-11>GPSPO,WIDE3-
3,qAS,KC7DBA:$GPGGA,162459,4359.7635,N,11638.8613,W,1,09,1.0,30884.6,M
,-18.3,M,,*7E

30,884 meters equals 101,300 feet to the nearest 100 feet.

Hank

4833. Re: Draft 02G track map

Randy,

This should help visualize what happened.

I've divided up the track into 4 pairs of corresponding
wind regimes. The pairs match roughly in direction.

They're labeled as A, B, C, and D; with A being the closest
to ground and D being the highest. The A pair leaves a bit
to be desired as far as matching, but that's because surface
winds were more variable with the difference in location,
topography, and time of day.

D pair indicates roughly the high-winds-at-high-altitude
track that took this balloon further than most of the
projections showed. Note how D winds are distinctly more
southerly than C winds.

All short distance balloon tracks display this approximate
track symmetry. There's a real funny one on the ANSR website
that makes a real doozy of a loop due to a complete reversal
of the wind at high altitude.

I was referring to a "hard wire" to the vfo button switch. No relays involved. Maybe more code to allow momentary contact of the vfo
switch to go back and forth from vfo A to vfo B. Would not add any more weight such as adding another radio.

Harry

Technically it should work, but if anything went wrong, you could wind up losing your data and backup signals. Most manufacturers spend quite a bit of time making sure their transmitters are tightly RF shielded. By opening up the transmitter and (effectively) adding an antenna to it's internal guts, there's no telling what may happen. Introducing high levels of RF directly into the microprocessor is just asking for trouble. If the transmitter somehow missed one of the switches, be it RF interference, bad code, etc, you could wind up transmitting your APRS on the backup freq. and CW on the APRS frequency. That would sure constitute a scare in the least.

I think that if you want a backup transmitter, you should put a totally independent second transmitter on board. This includes a separate battery, transmitter, controller, antenna. Just because you're transmitting on two frequencies, it doesn't mean the controller hasn't gone into an infinite loop, or the batteries aren't dead.

I think what would really be slick, is a second transceiver running split to receive the APRS packets and transmit on a different frequency. Using an intelligent controller board that could decode APRS packets, you could let the backup system sit idle until it stopped seeing packets from the APRS transmitter, at which time it would begin transmitting. The controller could transmit either barometric pressure or inside and outside air temps back to the ground via CW so that the chase team would have a reasonable idea of it's altitude.

Just my thoughts.

You bring up some very good points and I am in agreement somewhat. Not having the experience that I'm sure you do, I can only offer
what I think would be feasible. There is a whole box of what-ifs that we can explore and Murphy is always lurking. This would not be
such an exciting hobby as it is if we were not able to experiment and share ideas!

Thanks Jack!

One thing I noticed right away was that under the 'helpful websites' section
you still have the TVNSP site listed at www.the-one.com/tvnsp

Just for your info, although it's lower than Stephanie's,
this is the highest igated:

KD4STH-11>GPSPO,WIDE3-
3,qAS,KC7DBA:$GPGGA,162459,4359.7635,N,11638.8613,W,1,09,1.0,30884.6,M
,-18.3,M,,*7E

30,884 meters equals 101,300 feet to the nearest 100 feet.

From: verhap@occ1.sd01.k12.id.us
Topic: 1077 Message: 4847

I just looked at my last email, please forgive the misspellings, I got in a hurry.

The ascent rate for the capsule was initially just over 1000 ft/min. At around 75,000 feet, the ascent rate climbed up to just over 1200 ft/min. I guess a good average is 1050 ft/min.

The last descent speed at some 9000 feet elevation was around 1150 ft/min. So at sea level it would be closer to 900 ft/min.

Tim suggested we use Emmett for a launch some time. The field he showed us was huge, we could launch dozens of balloons there. Tim then suggested we have a Northwest Super Launch (NWSL). I like this idea. Perhaps this spring we could host a multiple balloon launch. We should have several more capsules constructed by then (hint, hint). There's at least two other groups in Washington interested in launching balloons. I'll see if they think they might be ready.

4848. [tvnsp] Re: Draft 02G track map

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-10-22 14:51:55 UTC
From: Randy Farley
Topic: 4829 Message: 4848

Interesting Hank

Descent looks like an identical image of ascent as should
be. Good explanation and graphic comparison. I do well
with pictures.

Does the parachute also act like a balloon and
travel according to the winds? I'm assuming it should
barring any extraneous debris hanging from the chute
causing gliding changes in directions against the wind.

If you need data to fill in the D descent hole afte burst,i can send you my laptop map from the chase.

Thanks

Randy

>>> n1ltv@... 10/21/02 02:06PM >>>
Randy,

This should help visualize what happened.

I've divided up the track into 4 pairs of corresponding
wind regimes. The pairs match roughly in direction.

They're labeled as A, B, C, and D; with A being the closest
to ground and D being the highest. The A pair leaves a bit
to be desired as far as matching, but that's because surface
winds were more variable with the difference in location,
topography, and time of day.

D pair indicates roughly the high-winds-at-high-altitude
track that took this balloon further than most of the
projections showed. Note how D winds are distinctly more
southerly than C winds.

All short distance balloon tracks display this approximate
track symmetry. There's a real funny one on the ANSR website
that makes a real doozy of a loop due to a complete reversal
of the wind at high altitude.

4850. In-flight QSY

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-10-22 18:27:45 UTC
From: n9xtn@cox.net
Topic: 4850 Message: 4850

You may want to take a look at what ANSR is doing with this. They use a Maxon data radio that has only a DB9 for control/signal and a BNC for antenna. You can pre-program it with 16 frequencies and then tell the radio to QSY to the desired one. I believe they use this to QSY their repeater to another UHF frequency, send an APRS posit, then QSY back to continue on as a repeater.

Do a Google search for 'Maxon SD125' for more details. Some of the specs indicate the VHF version covers 2m amateur band, some say it's good for 148-174. There is a UHF version that covers 70cm.

Downside is the price - in the $190-250 range. Radio has 1W or 5W output, requires 9-18 VDC, weight about 10oz.

- Mark

Mike,

There are no reservations and I don't believe there will be anymore. We haven't had a chance to discuss this yet but here it is. The manager of Jade Garden had decided that our group is to small. If we use the conference room and not everyone buys dinner he doesn't make much money. If we want to continue to use the room then each person has to buy dinner or pay $5.00. The manager's decision is strictly a business decision. He needs to save the room for bigger groups. We can still meet at Jade Garden in the regular section but there's no room for our stuff and we can't do any training. We need a new meeting place.

As far as a launch goes, I don't know. Paul is planning to launch his same capsule's again but nothing was said about a schedule yet. He is going to or maybe already has ordered another balloon.

Do we have a balloon? I can order a 1500 gram balloon at the end
of the week. I think John ordered a 350 gram balloon.

I won't have my capsule ready for a while, I need to find out what's
happening that the flight computer locks up.

These are the same questions I asked Paul off line. We had scheduled a launch Nov. 2, but so far there is no balloon. Also, Paul indicated that we may do another 1500 gram balloon. Not sure where I heard this. As to meeting with Jade Garden or anyother place, the problem is there are not enough of us to make use of a conference room. Some places require 20, 30 or more people to reserve them.

If I hear anything new I will let you know.

4861. Meeting Place

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-10-23 14:44:00 UTC
From: Stephanie Steele
Topic: 3139 Message: 4861

The Sizzler in Ontario has two back rooms that may be available if we want to move the meeting this direction and keep them as dinner meetings. There is also the training room at the Fruitland City Hall that can be reserved as needed.

4862. ORB-2

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-10-23 17:55:48 UTC
From: Harry M
Topic: 4862 Message: 4862

FYI

ORB-2 is tenatively scheduled to fly on Sat. Nov. 9th.
This will again be a 3ft balloon with a micro-beacon.
Altitude - UNK Burst - UNK
Launch site will be from within a 25 mile radius of Tulsa, Oklahoma.

Harry
KC5TRB

4863. TV02G Altitude Record?

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-10-23 21:00:40 UTC
From: Mike Garske
Topic: 4863 Message: 4863

Group,

Are we going to submit TV02G for the altitude record? At 101,300~feet, looks like we would be #8 on the list, and our first in that category!

Mike KC7DPD
www.tvnsp.org

4864. Balloon PIREP

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-10-23 21:26:08 UTC
From: n9xtn@cox.net
Topic: 4864 Message: 4864

Just happened to see this while I was looking over PIREPs this afternoon.

CVG UA /OV FLM110035/TM 1857/FL370/TP A320/RM REPORTED SEEING A BALLOON

For those not familiar with PIREP coding, the report came from Covington KY (Greater Cincinnati Airport). The aircraft was an Airbus A320 at FL370 about 30 nautical miles ESE of the Falmouth KY VOR (or about 60 n. mi. ESE or SE of the airport).

So they must see weather balloons now and again.....

I can't find anything indicating that NWS requested any 18Z soundings today - sometimes they do for severe weather situations.

- Mark

4865. ORB-2

Yahoo group: tvnsp (2000 — 2002)

From: Harry M
Topic: 4862 Message: 4865

I goofed on the ORB-2 post!

ORB-2 is tenatively scheduled to fly on Sat. Nov. 2nd with backup date of Sat Nov. 9th.

Harry

4866. Meeting Location

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-10-24 05:32:55 UTC
From: Bill Herrmann
Topic: 4854 Message: 4866

At 06:30 AM 10/23/02 -0600, you wrote:
>The manager of Jade Garden had decided that our group is to small. If we
>use the conference room and not everyone buys dinner he doesn't make much
>money. If we want to continue to use the room then each person has to buy
>dinner or pay $5.00.

I'd think we might be able to find a place with a slightly smaller meeting room that would be more understanding of a small group. I can think of several offhand. (Of course, they're all in the Boise/Eagle area so they don't help that much.)

What about that pizza place where you guys used to meet? (On the Nampa Caldwell Boulevard.)

I'd be glad to check with a couple places here in Eagle that have smaller meeting rooms. It would be a little further than Nampa, but not too bad for the close to the border crowd if you come in through Middleton.

Hmmm, anybody know Middleton well? A business there might just welcome the additional business.

>The manager's decision is strictly a business decision. He needs to save
>the room for bigger groups.

Again, that's an awfully big meeting room for us. Probably a good decision for him.

BTW as long as the place is kid friendly and not overly expensive I'll be glad to add greatly to the host restaurants revenue stream by bringing my balloon chase crew...

I wouldn't mind mixing up the location a little and am not allergic to travelling to Ontario etc. as long as meetings aren't too early. For training could we use the Hobbytown location? (obviously a more central location might be better)

Bill

p.s. Please forgive the rambling - it's been a long day!

------- Forwarded Message Follows -------
Date sent: Wed, 23 Oct 2002 13:59:11 -0700 (PDT)
From: "K. Mark Caviezel" <kmcaviezel@...>
Subject: Re: NSTAR 02-F ...."ES-OS SIX" EBBE... the plot thickens.
To: "Ralph Wallio, W0RPK" <wallio@crosspaths.net>,
"Paul Verhage, KD4STH" <paul.verhage@...>,
"Mark Conner, N9XTN" <mconner1@...>
Copies to: Gary <redyns@...>, gsnyder@...

Very cool, Ralph.

ok, breathing a little more fidelity into the EBBE
planning - it's 505 miles from Denver, CO to Treynor,
IA. We'll use that range for EBBE planning, in all
likelihood though the Denver balloon will ascend
slower, translate more to the east than the NSTAR
balloon and shorten the balloon-balloon range.
I use (conservative) 1.2 x sqrt (alt) = distance in
miles for radio range. When both balloons are at 50k
feet, range is 537 miles. Any possible high terrain
between here and there will be negated by another
minute or two of ascent. And it's true that 60/40,
70/30 and 80/20k feet altitude combinations yeild
predicted radio ranges in excess of 505 miles.

Sunrise here on November 2 is 7:28 am. I'm going to
plan for a 7:30 launch, although I am going to hook up
my wind logger to see if I have any 'lulling' that
follows a pattern, so my planned launch time will
change.
(last summer, we had a wind logger running for months
at a location five miles from here which showed no
useful predictable trend for lulls that would be of
interest for filling and launching a balloon, but near
the Rocky mountains, five miles may make a
difference).

Assuming the Denver plastic balloon makes a 700
foot/min ascent rate for the first 50,000 feet of
ascent, it will reach 50000 AGL at 8:41 am mountain
time.

Meanwhile, over Iowa, Mark Conner's balloon will
probably make a 1000 foot/min ascent which is typical
of a lot of latex flights I've seen.
Neglecting the neglectable altitude of Iowa, if the
NSTARians launch at 7:51, both balloons should make
50k feet at about the same time. Tell you what,
Mark, why don't you schedule your launch for 8am
(mountain time, that would be 9 am IA time, wouldn't
it?) That way the "ES-OS" balloon will get a little
head start. In a nominal flight (please hold your
laughter!) we'll have a balloon-balloon window over
half and hour. I agree that timing is essential, but
since the balloon-balloon range is 'only' 505 miles we
do have a reasonable chunk of margin to make up for
off-nominal performance.

My cell phone is 720-333-2248, feel free to call early
and often for updates. I'm a UHF/VHF guy so any of
the neato long range HF stuff is beyond our
capability.

I checked with the Chicago Connection in Eagle tonight about their meeting room. (What can I say - I was there anyway...)

There meeting room will hold up to 50. Minimum is 10 people to reserve it. They did suggest preordering as it makes things run smoother, but that was probably due to the fact that I was there with my U7 soccer team. For our use ordering as we go would probably work fine.

I suspect we could get away with not everybody ordering food as long as 10 did. I didn't check on any particular nights, but I did want to get an idea.

I think the Roundtable has a slightly smaller meeting room.

Again - just getting some comparisons - meeting in a more central location is just fine with me.

Raven makes zero pressure balloons (ZPB) from polyethylene. I
visited them last year. The balloons cost more than latex and are
really designed for larger payloads (a ton or more are flown by the
NSBF).

The next meeting is scheduled for Nov. 1. It was suppose to be a preflight meeting but in talking with Paul last night we decided to delay TV02H. Stephanie, can you reserve some space at the Ontario Sizzler for us? We will meet there if you can. A room would be nice but if one is not available, we can meet in a corner. Plan on around 10 people.

We also talked about the ES-OS Six flight and are wondering if it would be possible to try to communicate with the capsules? We will visit more about it next week. Not sure about any training at the next meeting. I will have to look back at my notes for that information. Will let everyone know.

Hope this helps in planning.

The room is reserved for us at 6:30pm under Treasure Valley Near Space.
If changes need to be made call 889-5005. I will most likely not make
this meeting, or will be late, unless I happen to make it back in time
from a training I am attending in Washington.

4893. Re: [tvnsp] TV02G Spreadsheets

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-10-26 19:40:20 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 4882 Message: 4893

Internal temps rise once the capsule enters the stratosphere. The
hope is to keep them from falling too low during the flight by
packing them in an extra styrofoam box placed near the GPS
reciever.

Paul

> Thanks Paul. I couldn't follow all the temperatures in the first spreadsheet.
The last one was the most simple. It appears that the batteries warm up
as they are drained. Is that heat captured in the battery compartment?
That would explain the warmer temperature as opposed to the apparent ambient temperature.

4894. Locking Out Email Addresses

Project Traveler's first was 22 April 2001. We initially called it Beta 1, but now just refer to it as 2001a. Payload consisted of a 2m APRS (VX-1R, Garmin GPS-35, homegrown controller) and a backup transmitter (the 29MHz TTL oscillator). We also had an externally mounted 35mm camera that froze up after a dozen or so pictures.

There's a full write-up of it at
http://www.rckara.org/project_traveler/2001a/

I've got 2 you could have. If you don't get enough let me know and I can talk to a guy I know that manages one of the Commercial Tire stores. I'm sure he could loan you a few.

It probably isn't necessary to go to those lengths. I believe I recall that you're now moderating subscriptions and it's been my experience that most spammer ids are pretty obvious. In other words, you can just fail to confirm ones that look suspicious.

I haven't checked the numbers lately but the list I run (about 1100 members) has a number of legitimate email addresses from both services.

Paul,

I think I have your website all downloaded and added to the new one. When you have a chance, can you please take a look. You can access the archives for previous flights and videos.
For all your procedure links, you can click on the procedures and operations link.

I downloaded 2 of your 3 videos. The last one is too large to post on the site, so I have downloaded it and will have it available to anyone who wants it.

If you have any questions or concerns, please get with me.
Other than that, I think the other site is ready to shut down, giving VOI more space to work with!

It's been fun working with you and the group. We've still lots of work to do on the site, but hope it is meeting everyone's standards.

Andrea

Hi Paul,

Re first voice repeater:
Same basic crossband repeater still in use by EOSS. Built for EOSS by Glenn Cascino WN0EHE, Bob Schellhorn N0TI(ex-W6ORE) and Bob Ragain WB4ETT, all members of the Rocky Mountain Radio League (RMRL). Since its first flight, it's undergone a number of improvements, including a self-erecting ground plane and APRS packet overlay. This package flew during GPSL 2002 and most recently on EOSS-60, where it was used to relay an SSTV image from the T&R crew to the ground station.

And kudos on the ISO date format! Just like the civilized world!
Next is metric and 24-hr time .... right after Liberia ....

73 de Mike W5VSI

Following is from the EOSS handbook:

E0SS-7 (RMRL DUAL BAND REPEATER)
PLANNED LAUNCH DATE: July 8, 1992
PLANNED LAUNCH SITE : Robert F. Clement Park [near Denver, CO - Mike]
BALLOON: Kaysam Meteorological Balloon #100G Weight: 1000 grams. PAYLOAD
PACKAGING: Type III
PLANNED LAUNCH TIME: 08:00
LAUNCH/TOUCHDOWN TIME: 08:00/1036 LOS 09:40 burst 10:55 recovery
ACTUAL ALTITUDE: No instruments
ASCENT/DESCENT TIME: Aprox. 140 min./Aprox. 56 min.
ASCENT/DESCENT VELOCITY:
TOUCHDOWN: 5 miles east of I-25 @ El Paso County line
EXPERIMENTS: Rocky Mtn. Radio League cross band repeater
which weighed 3.1 lbs. and a 10 meter beacon.
SPACECRAFT FREQ:
Input 446.000 Output 147.555 [RMRL Repeater freqs - Mike]
10 Meter beacon 28.321
GROUND NETWORK FREQ: Public info, long range tracking: 7.232
PROJECT LEAD: Bob Ragain
BALLOON LEAD: Merle McCaslin
LAUNCH SITE LEAD: Jack Crabtree
TRACKING & RECOVERY: Greg Burnett
COMMENTS:
WEATHER CONDITIONS: Winds Calm and CAVU
RESULTS: Worked very well, Balloon tracked visually during ascent. Burst confirmed visually.

> Any info on a revised date for TV02H?

Yes, or at least, TV02G.

I'll order a 1500 gram balloon today. In a week or two, it should be here (The Pony Express arrives on Thursdays, right?).

The flight computer in TV02G had three errors.

A. The the preflight loop, where we get a ten minute countdown, was instead set to a 0 minute count down.

B. The GPS reciever was not programmed to send the PGRMV sentence. Therefore, the flight computer would lock up waiting for it. Actually, this presents another problem, as I coded a timeout in the program. Why the timeout didn't work, I don't know. More work to do on that one. The other GPs was programmed to send the PGRMV sentence. I switched the recievers out, not realizing this. Both recievers now send the PGRMV sentence. Now they are logically and physically identical

C. The launch photograph routine didn't take into account if the capsule was out of preflight mode. Therefore, as soon as it jumped out of the countdown, it would take a photograph. This is a problem, because without the countdown delay, there's no time for the GPS to get a position fix.

All three problems have been corrected. I ran the capsule last night and watched it move out of preflight mode properly.

So, who wants to fly first? Jeff and Stephanie both have capsules they could launch. There's a 350 gram balloon somewhere coming our way that would work for Jeff's capsule. I have experiments I want to fly on the 1500 gram balloon. I supose there's no reason everyone's capsule couldn't go up on it. We wouldn't make 100,000 that way, but you may not feel that's a problem.

So two balloons, two flights.

Paul

Harry:
"ES-OS" stands for 'Experimental Sub-Orbital Society'. It is my group, really just a couple friends that are currently pursuing experimental home built plastic balloons. I always write it with the hyphen and quotation marks to provide a level of differentiation versus the longtime Denver area ham/balloon group EOSS. And to that end, mission numbers are written out instead of using numerals.
There isn't a real website yet but there is an email list and photos posted at

http://groups.yahoo.com/group/ES-OS_Launch/

So far we've had six official flights (including a small 2100 cubic foot bag which flew as EOSS 55, thusly does not have an "ES-OS" mission designation), with smorgasbord of successes and 'learning opportunities' thrown at us so far.
Our biggest bragging rights to date come from the 28000 cubic foot bag which we flew to over 107k feet on August 11. The recent "ES-OS FIVE" mission attempt was a 14000 cubic foot bag slated to hoist a 40 lb 3'x3'x6' gondola but alas we had gusty winds during the fill and the balloon was destroyed (with 56 lbs bouyancy (!)) before we could launch it.
This coming Saturday we are going to fly a 10000 cubic foot bag with a small tracker and TNC package out of Denver. Right now things look favorable that we'll be able to do a 505 mile range EBBE attempt with the NSTAR group which is launching out of Treynor IA. If all works as planned (hahahaha!), the "ES-OS" balloon should float between 95k and 100k feet for a goodly amount of time before we cut it down. One of the "ES-OS" members just bought a near-200 mph capable plane so if the balloon is floating good and the winds are moving fast at that altitude, we may 'let it run' to the east some ways before sending the cut down.
I'll need to check the flight prediction to see if it's possible for you to reach the TNC on "SIX" after it ascends and floats to the east a bit. If you are into packet radio, you (and all hams) are invited to listen/transmit on 144.34 to reach the "SIX" TNC when it is up high. Unlike latex balloons, properly performing plastic zero-pressure balloons can give

hours of loiter at max altitude. Join up the "ES-OS"
email list for details as they are available.

Congrats on your recent flight, I particularly liked
the photo of the pre-filled balloon, which beats the
heck out of dragging out a heavy helium bottle to your
launch site.

Hi Mark,

Thanks for the info. I have been to the group-site in the past.
I am now subscribed so's I won't miss any flights.

I will not fly ORB-2 this weekend so's I can follow your flight
and get my other dedicated partner back in town. As long as
you got it up there, let SIX float!!! I will watch for possibility
of the flight track to go further toward SW Mo. If it looks like
it will, I will head up toward Joplin.

Heh, Heh, I like the pre-fill method too. It does make me a little
nervous. Expecting the "BANG" somewhere along the 20 miles
to the launch site. :) Can't fill another with this method though.

I still have my 4 meter solar balloon in bag ready to have the
panels taped together. I would like to send a real cheap beacon
up on that one for a test flight.

Good luck on SIX!
Harry

You (and the rest of the group(s) for that matter) really should check out www.openoffice.org. It's a totally free, open-source office project that is very impressive. I've been using this and its precursor for several months now and overall like it. There's a few gotchya's when you really dig deep, but handles most Word docs, Excel spreadsheets, PowerPoint presentations, etc very well.

We've been using the presentation software at work since January on a PC that runs marketing stuff 24/7. We tried PowerPoint but it would crash at least once a week. We switched to this and it's been running for six months with only about two reboots and they were due to power loss.

Sorry for getting a little off-topic...

The next date that I have where I could be involved in a flight would be November 9. After that my work schedule will prevent me from participating until December 14.

Also, I am still waiting on my thermochrons from the supplier. They are coming via snail. He left 2 months ago, should be here any year.

John the elder,

I called Paul at Kaymont today and the balloon was never shipped. Paul said there are two reasons for this. The first is that the Military is there highest priority right now. The second is short supply. The short supply is caused by the West coast walkout. I told him to cancel the order for now. I think you should call Kaysam and see what they can do. It was my impression that the original plan for the balloon was to fly Paul's capsule on a short flight from Valley View. I'm not sure what the current plan is. I don't know if I can commit to flying my capsule in the near future due to other happenings. Perhaps this should be discussed at Friday's meeting. Are you planning on being at that meeting? I may be able to come to the meeting. What is the agenda for the meeting?

Harry,

Yes, I've been off the internet for about 5 days.
Please use this one that isn't as prone to overflow:

From: n9xtn@cox.net
Topic: 4929 Message: 4929

Kaymont seems to be stocking 350s - I got mine delivered last week. They're US-manufactured, so you don't have to worry about the inventory being stuck on a boat off Long Beach.

However, their 350s will likely go higher than Kaysam's 350s.

Is anyone interested in trying?

Paul

Paul:
note the map that Ralph Wallio put together.
It looks like we're gonna be short of hitting your
QTH. Note also, because I have added some equipment
to the flight, predicted float is now around 93k feet.

I'd be honored if the TVNSPians listen on the flight,
but don't think it's too probable to get signal.
However, if someone there has a hill top location,
correctly pointed beam, and gets the blessing of tropo
ducting (have no idea if balloon payload signals can
be tropoducted) well then maybe it's possible.
720-333-2248 is my cell number if you or any TVNPSians
want update morning of the flight.

I would like to welcome two new members to the TVNSP e-mail list. Both Ben and David saw Paul's picture in the December issue of Sky and Telescope, so I guess that it has hit the news stands. I'm sure that if Mike can view web stats on the sight that we will be receiving a lot of hits because of the photo.

I encourage Ben and David to come out to our meeting this Friday and get better acquainted with us. We will be meeting this Friday at the Sizzler in Ontario at 6:30pm.

Date and Time?

Also i have been playing with the "Packet Terminal" part of
Balloon Track. If we have time i might be able to demo
it a little. I recommend everyone read the new manual Rick, N0KKZ released.
This is another tool we need to be using next season in my opinion. His last flight was was accurate to within
2 miles (actual vs predicted) by adjusting to real time ascent data!

I haven't recieved my issues of S&T yet. The magazine said they'd send me a couple of copies. I'm upset that others are getting their's before I get mine. although, this seems typical of magazines.

Sky and Telescope publishes each issue just over a month before the issue's date.

Date: 2002-10-31 15:27:09 UTC
From: Harry M
Topic: 4941 Message: 4941

ORB-2 New Launch Date

ORB-2 launch on Sat. Nov. 2 has been moved to Sat. Nov. 9.
Backup date is Sun. Nov. 10.

This will be 2-3ft balloons with a micro-beacon on 147.455.
Tracking will be DF only.
Altitude - UNK
Burst - UNK

Launch site will be determined on either Thur. Nov 7 or Fri. Nov. 8
and will be from within a 25 mile radius of Tulsa, Oklahoma.

73
Harry - KC5TRB

4942. flight annoucement "ES-OS SIX" 6:30 am Denver, Sat Nov 2 launch

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-10-31 21:31:06 UTC
From: K. Mark Caviezel
Topic: 4942 Message: 4942

All:
The Experimental Sub-Orbital Society flight SIX ("ES-OS SIX") is slated for launch at 6:30 am MST on Saturday November 2. What started as a simple fun flight is shaping up to be pretty interesting as we'll be attempting to do a 500 mile range EBBE (Earth-Balloon-Balloon-Earth) digital link on 144.34 MHz. The other balloon will be launched from near Omaha, NE by the NSTAR ham/ballooning group.
The balloons should be able to talk to each other as soon as they are both at or above 50k feet. I have had indications from hams in Idaho and Tulsa they'll be listening in. Both groups are a ways beyond the predicted footprint, but heck, with good conditions and a beam antenna it is possible that those locations may be able to hit the balloon.
There has been some weight growth in the payloads so predicted float altitude is now about 92-93k feet.
Plan is for a dawn (6:30 am MST) launch from Sloan's Lake Park in Denver, CO. The launch will be from adjacent to the boat ramp near 25th and Sheridan.
All interested parties are invited to watch and participate in the launch.

The launch will use a single T bottle to get about 35% free lift into the 10k cubic foot polyethelene bag. The ascent and float are both predicted to be pretty much eastwards from the launch site. The winds are predicted at 97 mph in the jet stream near 39k feet and 63 mph winds at the float altitude.

Manifest:
N7QAM-11 "Skypumpkin" TNC package on 144.34 Mhz. node= BALLOO, digi = SIX. 3db twin lead jpole and 5 watts of power to reach out to the NSTAR payload.

KC0JHQ-11 APRS tracker on 144.39 MHz, one beacon per minute. This is running without DCD and may get QRMed in the Denver vicinity, but should give us good i-gating and coverage when we are out east of Denver.

Command cutdown on UHF and 3 hr timer back up.

This will be a test flight of the 'blow-top' method of flight termination.

Since the TNC and the tracker need at least ten feet
separation we'll be
unable to do a test launch from the white truck.
Launch and tracking persons will use the 449.225 MHz
Thorodin mountain repeater for communication.

Persons from out of the area can reach me at
720-333-2248 for launch status, however,
http://www.findu.com/cgi-bin/find.cgi?call=kc0jhq-11
should make it evident how the flight is going.

Air tracking is *go* for this flight, but alas the
pilot doesn't yet have enough time in the aircraft to
fly passengers so I will be tracking/controlling the
flight from the ground. If anyone wants to ride
along with me, they're welcome to do so.
Also, if anyone in the Denver area wants to help out
with launch, let me know. The launch site is near
Sloan's lake, about a mile west of Mile Hi Stadium.

The coverage map for the balloon packages is at

http://photos.groups.yahoo.com/group/es-os_launch/vwp?.dir=/ES-OS+SIX&.src=gr&.dnm=SIX_EBBE.gif&.view=t&.done=http%3a//photos.groups.yahoo.com/group/es-os_launch/lst%3f%26.dir=/ES-OS%2bSIX%26.src=gr%26.view=t

and if that long URL doesnt work, go to

http://photos.groups.yahoo.com/group/ES-OS_Launch

sign in, then go to the photos section, then the SIX
folder.

Nominal flight: 700-800 foot/min ascent will take
about 2 hrs to reach 92000 feet. This will take the
balloon to about 60 miles east of Denver. Then, a one
hour float will take us an additional 60 miles
eastward.
If winds are higher than anticipated I may send the
cut down command early.

- KMC kc0jhq

4949. Meeting Minutes 11/1/02

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-11-02 05:25:19 UTC
From: Mike Garske
Topic: 4949 Message: 4949

The meeting went well tonight, we discussed what the next couple months might bring as far as the groups activities.
Here's a quick run down on the agenda until the end of the year:

November 14th - Flight Readiness Review for TV02H - holding it at Mike's house at 6:00pm in Meridian. If you need directions, email me on the list or kc7dpd@...

November 16th - TV02H - 1500g Kaysam Balloon. Launch around 8 or 9am MST.

November 23rd -----Backup date for TV02H----------

December 14th - The Year In Review - Potluck at John & Debbie's house in Meridian - Bring something to eat and be ready to discuss next years plans for TVNSP launches.

Lets get a role call of all that can make these dates, or if we have to make adjustments. There will be minutes of the meeting taken and posted to the email list of all these meetings. Hope to see you all there!

Mike KC7DPD

Walmart makes calendars with photographs you give them. The cost is $19.98. Is anyone interested in geeting a calendar with photos taken by TVNSP? We'll need 12 photographs and need to select which month each photograph is made into. We cannot add text to the photos, they just print them as they are.

Let me if you're interested. If you have a photo to contribute, let me know.

Paul

Hi,
EOSS-61 & -62 are scheduled to launch from near Ft Collins CO on 11/16 at 0845 and 0930 MST. The KPC-3-equipped APRS module will run on 445.975 on EOSS-61, which is the input freq for the EOSS/RMRL crossband repeater with APRS downlink on 147.555 MHz. The fact of 70 cm for the APRS module does impair the possibility of an EBBE QSO, but one does remain.

I need the parachute back. I think John the younger has it. I'd like to make a new parachute ring for it. The current one is difficult to remove from the shroud lines, making untangling it a chore that it shouldn't be.

I made a new set of winders out of PVC like Mark Conner recommended. I have some extra PVC pipe. If anyone would like to make a set of lanyard winders, I'll give you the pipe and the bottle of glue. You'll need to purchase the following,

Four 1/2" PVC caps
Eight 1/2" PVC T's

All together, it should set you back about $3.

Oh, and you'll need some nylon line for your lanyards.

I need to get some help with rewinding my lanyards. I need to get the twist out of the line. Can I arrange to use someone's yard and extra set of hands?

According to the spec. sheet is does. Just do a search on the
Radio Shack site. Not sure how it powers up. It may need a
hack like the old tripmate, i hope not. One idea already brought up on the national sig,"
how about putting a TT2 in the battery compartment".

4971. Near Space Definition

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-11-04 17:41:01 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 4971 Message: 4971

In the past I wrote a short blurb on defining near space as those altitudes in excess of 75,000 feet. According to the FAI, space begins at 62.5 miles (100 km or 330,000 feet). So near space would be between 75,000 feet (my definition) and 330,000 feet (FAI definition). I'm now thinking of further divding near space.

There are three broad orbits around the Earth, low Earth orbit (LEO), middle Earth orbit (MEO), and geostationary Earth orbit (GEO). LEO tops out at about 1000 miles, MEO is around 10,000 miles, and GEO is around 22,000 miles. LEO is below and MEO above the worst part of the van Allen radiation belts (which is why you seldom see satellites between LEO and MEO).

The highest I've heard a balloon go is about 130,000 feet and most amateur near space flights don't make 100,000 feet. I was thinking about applying the LEO, MEO, and GEO terminology to near space. How does ythis sound to everyone?

Low near space is between 75,000 and 100,000 feet. Middle near space is between 100,000 and 130,000 (or the highest a balloon can rise) feet. High near space is between 130,000 feet and 330,000 feet.

This would mean balloons can make low and middle near space, but it takes a rocket to make high near space.

Another option is to take into account the altitude of the Mesosphere in the definition of high near space.

Any input?

By the way, I think I'll try to begin a 100k club for balloons that make middle near space.

Paul,
It was believed that the GPS35 from Garmin wouldn't output above 60,000 feet, UNTIL one was flown on BOI. And the only reason they had the celing listed as such was that it had never been tested above that altitude.

From: Randy Farley
Topic: 4962 Message: 4974

True

The main idea of the ring knife is that it is always available on the back of your favorite finger. One quick swipe downward and your string is cut.

No fumbling for something on a tether. I Will have to experiment with it while winding and unwinding a line.

I will bring one for next meeting to compare.

They are not as common as the seat belt cutter for
another con. Also ring size another consideration.
You could split the ring and make one size fit all.

Randy

>>> verhap@... 11/04/02 10:15AM >>>
It looks like the blade is more exposed than those in the seat belt
cutters.

Paul

> What do you think of this type of cutter Paul.
> Scroll down the page to the second from the bottom.
> It is called a ring knife. We use them here at work.

Harry

I Did some quick searches,but cannot find any documentation
yet. The McNally spec. site was down. Maybe have to
throw this one out to the aprs sig.

Price is great !!

Next step to search the tapr archives i guess.

Randy

>>> harrymue@... 11/04/02 08:54AM >>>

What about the Street Finder GPS for Palm III?
They can be had for $20-$60 on ebay.
Has anyone hacked these?

Harry
KC5TRB

It may need a hack like the old tripmate...

While I don't really think I can contribute much to this particular discussion, other than to say that I don't see it as a bad idea to get some type of formal definition out there amongst the various balloon groups. That way, when the various teams meet, they'd have a generic definition they could use for presentations rather than having to specify the exact altitude parameters. We all know that if you say you're gonna go to 100,000 feet, you're as likely to hit 70,000 as 130,000. This way, you can specify what your target range is.

Also, I think the mesosphere has to be included in any formal definition. It's already a formal factor used globally, and any terms we try to establish as standards should leverage off existing terms if possible, rather than attempting to provide more terms for the same thing.

My other point brings up an interesting idea, one that I've not put much thought into, but what about using a balloon to get a rocket up high enough to hit high near space? Or for that matter, space.

You can also get cheap calendar software and do the same thing with full control over the whole process. If you're interested in doing this, this might be a more useful alternative, as you'd likely pay the same or close price once and be able to put out a calendar every year.

Walmart makes calendars with photographs you give them. The cost is $19.98. Is anyone interested in geeting a calendar with photos taken by TVNSP? We'll need 12 photographs and need to select which month each photograph is made into. We cannot add text to the photos, they just print them as they are.

Let me if you're interested. If you have a photo to contribute, let me know.

I have a question that I've never seen asked nor discussed.

Is there a particular reason why all launches involve getting up before the sun to get to a launch location before the sun and to launch before the sun?

I'd be more willing to participate in the chases if they weren't so early. :-) :-P Or if I better understood the reason for always launching so early in the day.

I knew a couple years ago that it would work. The GPS35 uses
the GPS25 engine. The GPS25 engine works above 60,000 feet,
bu the GPS20 engine doesn't (or didn't a couple years ago).

Garmin makes it very confusing.

Paul

> Paul,

Because of the reduced air pressure and drag, a rocket launched
at 100,000 feet would travel about 2.5 times higher than launched
at sea level (according to a simulation run by the high power
rocketry group in Boise).

There's several issues to be resolved before attempting this, but I'd
like to give it a try before long. It's definitely a topic for my second
book (which I have outlined already).

Paul

It boils down to one factor, wind. We launch early to give us the
greatest chance of avoiding winds. Two benefits are that it gives a
longer period of time to recover the balloon and let's us recover by
lunch time.

Has to do with wind conditions. We discovered early on
that if there is to be a wind, it generally starts at
or a short time after sunrise. We have tried later
launches and on some occasions have had troubles.

Mike, can you email me some info on salaries at Micron?

I have a student who is interested in his salary at Micron if he gets an AS in Electronics Technology at BSU? After he gets a job with Micron, how much of his education does Micron pay?

Then, what's the pay scale like for him with a BS and a MS?

Thanks, we just need general numbers.

Topic: 4987 Message: 4987

Paul -

Does your Basic Stamp Flight computer program detect specific altitudes in the NMEA string? I have a nearly complete collection of items needed to return a glider to my desired Launch point. I don't want a lot of down range drift though. I'm hoping you can help me write a program for my Stamp that will allow me to activate my cutdown device once I have gotten to a specific altitude. My early testing will be dropped from about a mile up from an RC Aircraft. after that though, I would like some preliminary drops from a 25,000 to 40,000 altitude. Before it gets in the Jet stream. After that..... I guess it depends on how it all works and whether it actually comes back or not. Thanks Paul

Dan

Hi Paul,

Yeah. The biggest headache with that spreader ring happens when the topside goes thru the ring, etc. Worse than a Rubik's cube. But there's a simple fix:

I use bread ties to dress the shroud lines at the skirt, tight above the spreader ring and midway between 'em, plus tight below the spreader. They stay in place until launch string prep, when the launch crew removes 'em and stows 'em on the spreader ring; the recovery crew then uses 'em to dress up the shroud lines back to prelauch condition while they're still laid out straight at the landing site. Then the chute can be rolled up and wrapped with the neat rope of shroud lines for the next flight.

My flight computer (CC/PS) reads and parses the GGA sentence.
Experiments like cameras are operated based on the altitude. I'll
send you a copy of the flight code I currently use.

Here's the code I use to read altitude from the GGA sentence.

Paul

```
GPSStat var Status.bit1 '0=good gps, 1 = bad gps
i4800 con 16884 '4800 baud n81 inverted
gps_rx con 7
alt_curr var word 'current gps alt (m)

serin gps_rx,I4800,10000,NoGPS,[wait ("$GPGGA"),skip 45, dec
alt_curr]

NoGPS:
GPSStat = 1
'gosub FlightTerm
EndGPS:
return
```

Hi Paul,

Note also that when it's dressed and rolled up, the entire chute,
spreader ring and attached DF beacon/cutdown receiver fit nicely into
a plastic kitchen trash bag. Keeps it neat and clean between flights
and makes it easy to transport.

Thanks!

> and makes it easy to transport.

My plan ios to sew a tube of fabric with a velcro strip. The chute is laid inside (after it's untangled) and then sealed in with a velcro closure. The tube is then rolled up into a multi-turn loop and tied together with the carrying handle.

I'll use a heavy nylon fabric that is resistant to ripping.

At home I hang my 'chute from the wall. I don't wrap and pack them until the night before the launch. I assume this is done with human parachutes.

all Electronics is now selling Blue/UV LEDs. If you want a
hazardous LED, this is the one to buy. They cost $1.75 a piece.
A couple of my students want me to oreder some for the class.

www.allcorp.com

Do a search on LED. The data sheet makes great reading.

4997. WIRES enabled repeaters?

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-11-06 16:52:06 UTC
From: Justin Formolo
Topic: 4997 Message: 4997

I just ran across this cool system while looking for a new Yaesu radio that is called WIRES. This is the first time I have seen this before. I was wondering if this area has such a setup yet or if it's on the drawing board? If anyone is wondering what WIRES is, here are some good websites to check out,
http://k0swi.microlnk.com/IRADIO/WIRES/System.htm
http://www.universal-radio.com/catalog/fm_txvrs/0890wire.html I was just curious. Thanks

Justin, KD7PIT

4998. Web hosting

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-11-06 20:16:13 UTC
From: Mark Conner
Topic: 4998 Message: 4998

I'm looking for a new home for the NSTAR web page. Serving large files off my cable modem connection isn't working, and I think I'd like to get a site going with my own domain name (www.nstar.org is available).

I don't think I'll require a lot of bandwidth per month (couple of Gbytes), but I do need a lot of storage space. I'm guessing I'll need at least 200 Mb for all the video files I'd like to have available. There are several companies out there that do this, almost too many to compare. I found a couple that have good rates, but putting video files on their server is against their acceptable use policy. I'd like something that can send at near 1 Mbit rates for other cable modem/DSL users. Any suggestions?

Justin

There are three IRLP nodes in our area. 453.250 and 449.700
if you want to play around with this. Do not know the third one right now.

They are designed for long distance contacts via VHF and UHF radios over the internet.

Looks like this is one of the easier systems to setup.
I know IRLP runs on Linux, so you have to master
another operating system.

There are other hybrids of this RF via the internet system
around. This is a pretty slick way to introduce people to
Ham radio.

I still prefer straight RF but everyone has his own
balloon to fly and gee wiz thresholds to satisfy. ;-)

regards

Randy Farley

I think I remember seeing some hosting services that specialize in streaming video. The concept is you have your nstar.org on some other, low-bandwidth (cheap) site, and just link to their server for video feeds.

Good luck - I'd be interested in knowing what you end up with.

I use http://www.aaces.com

They have great technical support, have all the features you need to stream like realaudio/video servers and they have a lot of bandwidth. I host http://www.jamradar.com off of them and they do a great job.

If you pay for a year at a time for a 50 MB account it costs $9.95 per month.

5002. ORB-2 Launch Update

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-11-07 01:32:45 UTC
From: Harry M
Topic: 5002 Message: 5002

ORB-2 Balloon Launch UpDate

Payload - 2-Meter Micro-Beacon W/Tone. Frequency is 147.445
and is on for 7 seconds and off for 7 seconds.

Launch Freq. - 146.585 Simplex
Chase Freq. - Claremore Repeater 147.090 (no tone)

Launch is still a go for 9am this coming Saturday,Nov. 9.
At this time the wind predictions are favorable for a
launch from the SkyBlazers R/C field in Collinsville, Ok.
GPS coordinates are N36 22.7342 / W95 49.9130.

Here are the directions from Tulsa. Take Hwy 169 north to
the Collinsville exit, turn left (W), go to the stop sign,
turn right (N), go to the next stop sign, go straight 1
mile (you will see the field on your left (W) turn left (W),
then 500 feet to the gate on the left (S).

The wind predictions are indicating a flight NNE-E-ESE
depending on what altitude is reached. (and that's a big WHAT)

If you are planning to come out please let me know ASAP. If you
plan to track and chase I would like to have a short meet before
launch to discuss the chase plans.

Even if you know nothing about what we're doing, come on out
and meet some of your fellow HAM's. It'll be a great day for
a drive in the country!

5006. Cheap tranceiver from Radio Shack

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-11-08 00:44:59 UTC
From: Zack Clobes
Topic: 5006 Message: 5006

I was just in Radio Shack here in Hutchinson, KS and they had their HTX-200 HT radios on sale for $50. I picked one up as a backup transmitter. They can run on 2 AA batteries to get 200mW or 9V external power for 2W output. It looks like it's an SMA connector for the antenna and the two plugs for mic and receive audio. The manual claims a weight without battery to be less than 5oz (I'm not sure if that includes the antenna or not).

A pair of lithium AA batteries and a small back modulator board would make a small, cheap backup transmitter.

Tony,

Yes, I'm definetely interested. As I recall, you wanted to
try to use an accelerometer to measure the vertical forces
throughout the flight and determine if we can reliably
measure the exact moment the balloon burst's. I am also
interested in that project.

Harry,

This idea has been talked about as well as others. One other would be to detect the upward pull on the load line. When the line goes slack that would indicate the balloon has burst. The suggestion is that we put together experiments to try all these methods. I believe that will happen this winter.

One thing that I noticed at last year's GPSL is that when the balloon burst on the ground, it really wasn't that loud. I heard a noise, looked up, and saw pieces of latex floating down. I think that wind noise would probably overpower a balloon burst - especially up in the thin atmosphere.

Have any of the camcorders picked up any noises?

Oh yes. There's a double boom when the balloon bursts. There's
no wind sounds in near space, but the expanding wave of helium
(perhaps?) does make a sound, the only sound, heard.

Here's my idea. The accellerometers produce a voltage dependent
on accelleration. The voltage output is dumped through a voltage
divider to ground. The BS2p taps the voltage across one resistor
and polls that I/O. When the burst occurs, the voltage spikes
above 1.4 volts, causing the pin to go high. Pin polling detects the
change in state, triggering the interupt routine.

My $0.03 worth (inflation)

We need to understand the output from the accellerometer and
how to use the polled interupt of the BS2p.

I heard the little "POOF" also, but at altitude the envelope is much bigger and more pressure. Bigger "POOF"! :)

If I remember correctly, someone on this reflector said they heard a burst from the ground. Now that's a BIG "POOF"

From: aerobotics58
Topic: 5015 Message: 5015

I understand there is a scheduled TVNSP flight this 16 November. I would like to include a small experiment in someones capsule but need a resource. Does anyone have a Thermocron to sell or that I could borrow for the flight. I am going to put together a very small insulated package of foam. I intend to put a small hand warmer heat packet inside. I can't make the launch as I have to work. I would need someone to activate the packet just prior to the launch. It then needs to be placed in the Foam package with the Thermocron. I would like to see how well this works as a heat source as the air thins and temerature drops. Also, does anyone have room in a capsule for this to go up in? It will be about double the size of a ring box and weigh only about as much as one too.

Dan

5016. ORB-2 UPDATE

Date: 2002-11-09 02:41:34 UTC
From: Harry M
Topic: 5016 Message: 5016

ORB-2 UPDATE

Launch Sit - Collinsville, Oklahoma (N36 22.7342/W95 49.9130)
2-meter beacon on 147.455 / 7 sec on - 7 sec off
2 - 28" (30g) balloons (Orange & Red).
Local repeater will be the 147.090, Claremore

Launch is still a go for 9am tomorrow, Saturday Nov. 9.
Wind profiles are indicating the ground track will be
010 - 071 degrees from the launch site in Collinsville.
A low flight will be more north and a higher flight will
be more east. Surface winds will be from 170 @ 10-20 or more.

Signal reports would be appreciated!

5018. pop

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-11-09 16:55:46 UTC
From: K. Mark Caviezel
Topic: 5018 Message: 5018

noise of balloons bursting -
yes, I've reviewed tape for lofted camcorders, the pop
of the balloon is very obvious, but there is a lot of
other noise as well, stuff shifting around, I think
the automatic gain control on the Sony camcorders
jacks itself way up and gets lots of stuff.
For a latex balloon, the ascent is continuous motion
and there is plenty of noise on the camcorder audio.

Jeff,
I've seen it at Barnes & Noble in Boise. It's in their magazine rack, but look low, it's on the bottom self mixed with the Sky & Telescope, Astronomy, and QST mags. Hope this helps out.

It seems pretty quiet once the balloon gets way up there. I've not tried determining the minimum altitude, but if ythe balloon bursts at 85,000, about the only thing I've heard is the burst. once the capsule is on the way back down, there's lots of wind noise (roar!).

But certainly early on, there's lots of other noise. Camcorders had a built-in level of noise. That may complicate things.

One of my SolarFloater decisions is which GPS receiver to use. Assuming
other specifications are close to equal the decision is based on power
consumption (the receiver will be running 100% to constantly feed data to a
115kbps telemetry link). Here are the power spec's I find. Please check
this over for gross errors.

GARMIN eTrex (TVNSP - EOOS)
Includes antenna and display
Power consumption unknown and not specified

5028. ORB-2 UPDATE

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-11-11 00:08:10 UTC
From: Harry M
Topic: 5016 Message: 5028

ORB-2 UPDATE

ORB-2 was launched at 09:07 Sat. morning. The beacon was heard loud
and clear as it sailed away (blown away) to the NNE. The chase crews
were late departing the launch area, you know, stand around and watch
the balloons sail away (oohs, aaahs & wow's), while shooting the breeze,
and there was plenty of it that morning. HiHi! Something like 18 mph
gusting to 28 mph. The first attempts from out on the road to listen
for the beacon were in vain. It could not be heard and was never heard
again. We vacuumed the countryside with our Ht's and antennas until
noon when we all gave up and met for a great BBQ lunch back in
Collinsville. Everyone enjoyed the beautiful day and can't wait until
the next time. We will be back!

Two stations heard the beacon from their QTH.
Jim-K5LAD, Owasso, Ok submitted this report:

I first heard the signal at 9:07 -- loud and clear.
9:12 - strongest signal from 10 degrees
9:14 - 20 degrees
9:16 - 20 degrees
9:18 - 15 degrees
9:20 - 25 degrees
9:24 - 30 degrees - weak signal
9:25 - 25 degrees - signal a bit stronger
9:27 - 15 degrees
9:29 - 20 degrees - weak signal
9:30 - 20 degrees
9:32 - 20 degrees - weak signal
9:34 - could no longer hear the beacon

and

Eddie-KC5TER, Chelsea, Ok said he heard it for about 15 min. after launch.

MORNING PLANETS: The planet Venus, which crossed from one side of the Sun to the other on Nov. 1st, is now a bright morning "star." Look for it hanging low in the eastern sky just before dawn. Now that Venus has emerged from the glare of the Sun, you can see four planets before local sunrise: Venus, Mars, Jupiter and Saturn. Visit spaceweather.com for sky maps and for pictures of Venus, which looks like a thin crescent through amateur telescopes.

AURORA WATCH: On Nov. 9th, an M4-class explosion near sunspot 180 hurled a lopsided coronal mass ejection toward Earth. Sky watchers should be alert for auroras on Nov. 11th or 12th when the cloud sweeps past our planet.

From: K. Mark Caviezel
Topic: 5031 Message: 5031

I recall reading in the Etrex docs that it's rated for
24 hrs on alkalines in battery saver mode ($&$*#*#
documentation tells you how to turn batt saver mode
on, but doesn't tell you what it does to the
performance), regardless, my etrex + TT2 unit has
worked fine for me on a handful of balloon missions.
I seem to get comparable performance out of the Etrex
that I run on alklines on the ground, although NiMH
AAs are only good for 6 hrs, probably because of the
lower voltage of the NiMHs.
Now, of course we're not going to fly alkalines.
Lithium AA's have significantly more total energy, but
the output is degraded if the batteries are cold
during discharge. I'm probably going to fly a
tracker on next EOSS flight next week. I may just
turn it on, then leave it on (outside, probably 25F
overnite) until it dies. Instead of logging, I may
just look at findu.com for last packet.

Some EOSS guys have been playing around with slow scan
TV. Check out MMSSTV, it's a pretty slick package
that will turn your laptop into a portable SSTV
broadcast device. (You can simply key the mic, hit
'go' on the laptop and hold mic next to speaker output
to generate tones without building a cable.

blue skies

5032. Re: Experiment

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-11-11 14:53:48 UTC
From: aerobotics58
Topic: 5015 Message: 5032

Paul -

I'm going to wait till next years launches. I have to get better prepared including getting a couple of thermocrons to use. Thanks and good luck. I'll see you on the 2003 launches.

Dan

5033. Re: [tvnsp] GPS receiver power consumption

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-11-11 15:09:09 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 5031 Message: 5033

The only problem I have with the Etrex is that it will not tun itself on
as the power comes up, you have to push the power button. We
had a flight where the batteries got too cold during descent,
shutting off the Etrex. Once the interior warmed up, the power
came back up, but the Etrex would not turn itself back on. It's kind
of tough to turn the Etrex back on when you can't locate it because
it shut itself off at 30,000 feet.

Jeff and I played around with wiring up the power switch for flight
computer control. I will probably incorporate that "fix" in my next
book (here I am talking about a second book when my first is only
70% complete).

Paul

> I recall reading in the Etrex docs that it's rated for
> 24 hrs on alkalines in battery saver mode ($&$*#*#

Nice Pictures Harry

What is your source for the party balloons you use?
How much free lift per balloon are you getting?

Good luck next time.

regards

Randy Farley

Group,

Just a reminder, we will be having a Flight Readiness Review for TV02H, scheduled for launch on Saturday 11/16/02. We are having it at my house in Meridian. If you need directions, please email me at kc7dpd@velocitus.net, and I will send them to the individuals who need them.

Also, we need to start watching the upper level winds from here on to Saturday. The forecast on weather.com says mostly cloudy on Saturday, so far.

Thanks Randy!

There is a local store called "Absolutely Balloons".
I get them there an they get them from Qualatex.

I tried to measure the lift on the first balloon filled, but
the wind was whipping it around and the scale never registered.
I didn't try the second one. The wind was really blowing and we
were afraid of a ground burst.

Dan,

I put in an order for 2 thermochrons through Dallas Semiconductor about a month ago, on the website it said there was a two week wait. Still waiting! Although the ship date is supposedly 11/4/02. I have received the thermochron reader so far. The part number for the thermochrons is: DS1921L-F52. They are listed at $14.39 each. Hope this helps!

I just checked Maxim today and most all thermochrons have a 12-week wait now - I was considering ordering a couple more for myself. They have a couple models in stock, but they're high resolution and narrow range (near freezing or near body temperature).

From: Hank
Topic: 5035 Message: 5044

Mike,

Chances are you'll not get any Thermochrons from Maxim.
People have been waiting over 18 months for their orders
to be filled. There have been some instances of one or
two showing up every once in a while, but there has been
no consistent supply for about 2 years.

As to what Maxim told Mark, they just keep pushing the
available date forward. This has been going on for over
a year. They were supposed to be available at this time
LAST YEAR.

I'm quoting below a message from one of the ibutton mail
lists written by a developer in Virginia who doesn't like
the lying. It's too bad Maxim can't tell the truth.

Hank

> may be available later.

The most intriguing question is why ThermoChrons were freely
available from Dallas before its acquisiton by Maxim, never
thereafter.

And why Maxim continues to take orders for these parts
knowing they will never ship.

> How much free lift per balloon are you getting?

Randy,

I've been discussing a few issues with Harry
so I can provide you some actual figures. Harry
has done some careful measurements and it
turns out that his big party balloons are very
close to 30 grams, which is a standard met balloon
weight so LIFTWIN can be used to get exact freelift
figures very nicely:

2 feet 3 1/2 ounces
2 1/4 feet 5 ounces
2 1/2 feet 7 1/2 ounces
2 3/4 feet 10 1/2 ounces

That's for helium, sea level, and 60 degrees.

Hank

From: Stephanie Steele
Topic: 5035 Message: 5046

It's even worse than lying. I called and asked them when my order placed September 1st would be shipped. In response they said they would send me a portion of my order that they had in stock. This consisted of three fobs, each in a large (24" x 36" x 17") carton, shipped on the same day from the same address, and charged me $10 shipping for each carton. For those who do not know, the plastic fobs weigh less than an ounce each and measure about 1" x .5" x .10".

They also told me that they are unable to get any quantity of Thermochrons and I would have to wait to get mine as the few they do get trickle in. They would not specify why the supply was short or if anything was being done about it.

When I called to complain about the shipping rip off they were not interested in hearing about it and in fact told me to expect more of the same as more parts of my order became available. This company is the pits to deal with.

The FRR is the Flight Readiness Review. We'll discuss the
weather, flight predictions, a launch location, driving plan, and
check out the near spacecraft.

Everyone's invited to attend (it's recommended, actually).

Topic: 5036 Message: 5049

I tried to use the forcasted prediction model that we have been using to get an idea what is happening Saturday. Apparently I am going to the wrong place or they have changed the web pages. I come up with a 'format not recognized' error for Balloon Track. Was there a change in the way the information is presented and, if so, how can we use it?

The URL I am using is:

http://www.arl.noaa.gov/ready/cmet.html

Thanks

Harry

What brought this up, a friend and i played around with some
12" party balloons from our local dollar store this last weekend.
We had them filled with helium and took them home.

We were able to determine neutral buoyancy with a
1/8 oz. weight. We used a postage stamp scale and some of my lead
sinker weights. I was quite surprised they would lift this much.

We launched them with various weights and multiple balloon
combinations tethered together just for giggles. We then tracked them
visualy with binoculars till they reached the clouds. They actually
did the classic hook on ascent going west first, then drifted back to the NE till
they were out of site. They followed balloon track's prediction for the morning
accurately as far as we could see.
We were able to watch one balloon for 17 minutes.

This was quite fun for a cloudy Saturday afternoon with nothing else to do.
Your use of party balloons inspired us to do this. For a mere $4 dollars (8 balloons)
we educated ourselves and got hypothermia at the same time.

Guess i should to get to work on my tracking equipment for a real launch
next season.

I don't think the neighbors were watching ;-))

regards,

Randy
N7GPS

>>> harrymue@... 11/11/02 05:27PM >>>

Thanks Randy!

There is a local store called "Absolutely Balloons".
I get them there an they get them from Qualatex.

I tried to measure the lift on the first balloon filled, but
the wind was whipping it around and the scale never registered.
I didn't try the second one. The wind was really blowing and we
were afraid of a ground burst.

73
Harry

Nice Pictures Harry

What is your source for the party balloons you use?
How much free lift per balloon are you getting?

Good luck next time.

Thanks Hank

I am going to bring some of my weights to work and weigh them on my gram scale to get more accurated information.

I need to make some calipers to measure the diameter
closer.
We checked Liftwin and it was very close to our guestimated
balloon diameter for free lift.

I would like to find some bigger party balloons like Harry uses.
Also get the neighborhood kids involved next time we play (referring to earlier reply to Harry) .

regards

Randy

> How much free lift per balloon are you getting?

Randy,

I've been discussing a few issues with Harry
so I can provide you some actual figures. Harry
has done some careful measurements and it
turns out that his big party balloons are very
close to 30 grams, which is a standard met balloon
weight so LIFTWIN can be used to get exact freelift
figures very nicely:

2 feet 3 1/2 ounces
2 1/4 feet 5 ounces
2 1/2 feet 7 1/2 ounces
2 3/4 feet 10 1/2 ounces

That's for helium, sea level, and 60 degrees.

Hank

Randy,

I'm glad your having fun! Keep me posted on what your doing.
Sorry 'bout the hypothermia! It's warmer in Tulsa. :)

Your local balloon store should be able to get the larger ones.
If they don't carry them ask them to order some. The store
here carries the 5.5 footer also. The 3' is $3 and the 5.5' is
$29. If you find the larger balloons and you have them
filled at the store, they usually don't like to fill the 3 footer
any more than 2 foot. ORB-1 was under-inflated and it was lucky
to fly at all. ORB-2 had no problem. Maybe ORB-3 should have
3 balloons and on and on. :)

I was going to suggest using a better scale. When I started
developing pyro formulas I tried several of the small scales
and ended up getting a triple-beam at a pawn shop for around
$40.

I am off to a friends house to take a look at some old Motorola
FM xmtr chips. He has a whole tube that he doesn't need. I'll
check 'em out and see if they might be useful for a payload.

5057. Thermochrons are essentially discontinued parts

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-11-12 19:54:31 UTC
From: Hank
Topic: 5057 Message: 5057

Stephanie,

Your treatment is the WORST I've ever heard of by a semiconductor company. I'd like to post an excerpt (without your name) to the ibutton email list.

What happened to you (except perhaps for the separate packages-same day trick) is standard practice for Dallas/Maxim and has been described in several messages to the company operated list (which is carefully read by Dallas staff). I would have mentioned all this earlier, but I didn't realize there was current TVNSP interest in the Thermochrons.

Two years ago Dallas offered various excuses for production delays and timetables for the resumption of Thermochron production, but starting about one year ago the product line manager refuses all comment on the subject.

Dallas continues to *cheerfully* accept orders for all Thermochrons and accessories, but only delivers the accessories, knowing that they are useless without the Thermochrons to snap into them, and knowing **full well** the Thermochrons are not being made in anything but trickle quantity at best and haven't for years.

Here's a clip from a September message from someone at Sun Computer:

> So in investigating, I find that I have to spend $10
> for the device and $10 for shipping, which is really
> outrageous (it was bad enough for the three parts, but
> for one it's just silly).

This person went on to ask if there were any outfit, such as a distributor, that might be better at selling to small customers, and the answer from another list member was that distibutors would be much worse than the Dallas/Maxim online store. Industrial distributors don't usually even stock Thermochron kits and prefer purchases over $1000. Dealing with these kits is a big nuisance to them and they make Dallas handle it.

Hank

It appears ARL has substantially changed their interface and outputs. Try the following:

At the point where you select the forecast hour and outputs, make sure "Graphics and Text" is selected. When you get the sounding graphic back, click on "Sounding text and any error messages". Save this file and Balloon Track should work as before.

I tried to use the forcasted prediction model that we
have been using to get an idea what is happening
Saturday. Apparently I am going to the wrong place or
they have changed the web pages. I come up with a
'format not recognized' error for Balloon Track. Was
there a change in the way the information is presented
and, if so, how can we use it?

The URL I am using is:

http://www.arl.noaa.gov/ready/cmet.html

Thanks

I didn't realize until Hank's response that Maxim sent three five-cent pieces of plastic in three separate half-cubic-yard boxes and had the nads to charge $30 for it. When I first read it, I was thinking she got the thermochrons too.

What's odd is that two other newer thermochron models are both available. At least, according to Maxim's web site - maybe that's less than truthful as well. You'd think something as apparently useful as a thermochron would spur someone to get them back in production. Or maybe it's just us balloon nuts.

This whole episode makes me feel a *whole* lot better about using their free samples. :) Or maybe I've been lucky so far and most of their samples are barely-functional batches that failed QA. :-0

This is a near billion dollar company (Maxim) that has
bought Dallas Semiconductor, so nothing will make
it budge unless it's a 10 billion dollar company
that buys Maxim (the law of the sharks). The purpose
of posting here is to wave potential buyers away from
the trap, or at least to forewarn you if you're the
optimistic type.

I didn't catch onto these tremendous Thermochrons
until they were no longer available. I'd like real
bad to have even one; I had all kinds of great ideas
for it as far as making custom readers for it.

There are other medium sized companies that are
all over the web who had already developed 3rd
party products for these, and I just shudder to
think what has happened to all these enterprises.
I checked on one just today and their web site is
nothing like it used to be. I was all set to order
a bulk purchase for TVNSP over a year ago from these
people, and through several phone calls with these
people found out that they were also being fed
fantasies by the Dallas factory. The trouble began
before Maxim took Dallas over, but I think Maxim
really was the nail in the coffin.

There is a possibility that a couple of narrow range
Thermochrons may become available, but they're no good
for what we want.

Here are just a few more sad messages from late October.
I was looking for the ridiculous product manager's
official company policy statement issued 12 to 18
months ago, but I couldn't find it. I suspect it was
removed from the list archives to avoid embarrassment to
the company because it promised plenty of Thermochrons
for everybody in just a few months. It's always just
a few more months.

Hank

[messages from late October 2002]

I am hoping that patience will pay off. The part has
apparently been redesigned for low temperature reliability.
The original design had a very low yield for parts that met
spec. At the end of September I was told that the new parts
were expected in a couple of weeks. It is now past that time,
but I am still hopeful.

I have an unfilled web order from Nov 26, 2001 that I am
uncertain as to the status of. I believe I have others
outstanding as well. They may have been cancelled, but it
is not easy to find out.

Dave

Hi all,

I have been listed on this and the 1 wire list for years.
Does anyone know when Thermocrons will be released? All I
see on the 1 wire mailing list are things like "our supplier
has been waiting for two years" and "suppliers cant get them"

Is there any point to having this list if the Thermocrons are
not available?

All I have seen from Maxim so far is that Thermocrons which
meet the stated spec are not available. Other Thermocrons
may be available later.

Regards
Terry

--- engineering@... wrote:

> Is there any point to having this list if the
> Thermocrons are not available?

many of us have lost lots of effort (and money)
developing systems and promoting an exceptional (in
theory) product just to find out that Maxim is not to
supply them any more...

I have been accused by potential clients of cheating
on them...

5066. Tuesday Evening Predictions for TV02H

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-11-13 04:06:28 UTC
From: K7JPS - John
Topic: 5066 Message: 5066

Here are my early predictions for TV02H:

Envelope: Kaysam 1500g
Ascent Rate: 1000 fpm
Decent Rate: 1200 fpm
Burst Alt: 97000 ft

Using a MRF model (modified with current winds above 85500 ft)
Prediction from 12 Nov 0Z +108hrs (for 16 Nov 12Z)
Range: 107 mi.
Bearing: 82 deg.

Using an AVN model (modified with current winds above 85500 ft)
Prediction from 12 Nov 18Z +84hrs (for 16 Nov 6Z)
Range: 93 mi.
Bearing: 97 deg.

The difference in these two models is about 28.7 miles but according to previous postings to this list the AVN model is just now coming into range. In fact you will notice that I was about 6 hrs short of launch time with that model.

The sounding from BOI on 13 Nov 0Z that I used to modify the models only went to 97999 ft. so I limited the burst altitude to 97000 ft. I noticed that above 90000 ft the winds steadily increased from 25 mph to 75 mph. There is nothing to suggest that that is where they max out.

From the last flight we know that we made 103000 ft. so with these wind speeds we could expect an even greater range.

A launch from Bully Creek with these models would land the payloads between Idaho City and Stanley. The MRF model shows a landing close to where the 7 hunters were rescued near Lowman Monday evening.

A launch from Rome, OR places the payloads between Grasmere and Hammett, south east of Mountain Home.

With the number of search and rescues already occurring for wild game hunters in the area, we do not want to become more statistics. Along with the FRR meeting let's also discuss being prepared for winter travel, and being smart about the chase and recovery efforts.

John
K7JPS

5067. Re: [tvnsp] FRR Meeting this Thursday 11/14 6:30pm MST

From: Bill Herrmann
Topic: 5036 Message: 5067

Not sure yet whether I'll be able to make the FRR, but I probably ought to have directions just in case.

I won't be able to make the launch but will be monitoring. Depending on how long the flight lasts I might be able to join for recovery.

I woke up at 1:30 this morning and decided to work on the capsules. They are complete and ready to go. The configuration is the same as the last flight. At the FRR we'll power them up and measure battery voltages. This time we'll drop an 18" glider, rather than a 4 foot glider.

The book now has 347 pages.

Paul

5069. Saturday's Prediction

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-11-13 15:59:24 UTC
From: John Knapp
Topic: 5036 Message: 5069

Using the AVN Model for Saturday, UTC of 1200 hrs, I
came up with the following results for Saturday's
launch:

Time: 127 minutes
Bearing: 98 degrees
Distance: 110 Miles.

If launched from Bully Creek the parachute would land
approximately 10-15 miles north of Featherville.

If launched from Vallivue High School it would land
approximately 10 miles west of Fairfield, about 2
miles west of Moonstone Ranch.

If launched from Brunea SP, it would land about 2
miles west of Minidoka Dam.

What bothers me the most is the winds max at 45000 ft
at 105 mph.

Have others had the same results (using 95,000 burst,
1000f/m ascent and 1200f/m decent)?

This shows why the jetstream will be so strong Saturday.
Wednesday shows a nice lull. Friday is actually the worst
with a band of 125 knot winds right over Idaho and Utah, the
strongest in North America.

Using +72 hour AVN data, I get 107 degrees at 106 miles.

The concept to keep in mind is that at this long distance
of 100 or more miles, the tolerance on the landing spot
has to be a pretty big circle.

An error of only 5 degrees with the range exactly right
will already be in error by 9 miles. A circle 25 miles
wide would probably not be excessive.

It all depends on probability, so it's possible
that the final landing could be the closest TVNSP has
ever achieved; it's just not very likely with this kind
of range.

Hank

I did the prediction too early this morning (8:30).
This afternoon I had the same results you did. Trying
to hit a 25 mile wide circle without having a river,
canal, power line, forest, military base, freeway, etc
is a big challenge, but can be done.

Tomorrow night we will be meeting as a group and will
go over predctions, launch sites, and landing sites.

Thanks for the comments,

JohnK

If you do think of filling the Kaysam with
more gas than the last time to get it down more
quickly, you could use LIFTWIN and the 1500 gram
Kaymont entry. Whatever result it gives for burst
height add on about another 12-15k feet.

I have received the entire set of data from Kaysam,
but several of the numbers are physically impossible,
so I know at least some of the information is faulty.

I guess Kaysam has been in the habit of underrating
its balloons, since Bill Brown's program adds 25%
to all the Kaysam burst diameters. Kaysam is now
saying 33 feet for the 1500 gram, and the Kaymont
1500 is 31 feet. It seems like the actual burst
figure achieved the last time for the Kaysam was
about 37 feet.

Hank

5075. Kaysam 1500g burst altitude

This message was sent to me. Is this something TVNSP would like to get involved with? The VP of VOI is experimenting with a microwave transmitter for video and 24dB gain parabolic dish antennas on recieving stations. This may be the place to start, as the 440 ATV gives poor signals with one-watt transmitters.

Paul,

This was not easy to find your contact information!
I am contacting you in regards to an art project that involves radio transmitted video on weather balloons. This is an international project on the global simultaneous launch of weather balloons from remote islands. Mission ☐BIN¹, Balloon in No Man¹s Land. I am documenting this moment from the ground and from the balloon's view. Conceptually I am interested in this event as the only daily global event where all nations collaborate peacefully and that builds a global network, even to the remotest places on earth. This project will be presented in various international galleries and museums, and in a book published by Triton.

The islands I 'did' already are Jan Mayen in the North Atlantic Ocean and the Kerguelen Group in the South Indian Ocean. In those cases I was using equipment that allowed a transmission of up to half a mile. My next destination in December will be Willis Island, Australia. For this island I want to use technology that will transmit the video signal much further, ideally even to the stratospheric point when the balloon finally bursts. To achieve that I would like to collaborate with amateur radio specialists. ☐Professionals¹ who have already done this and can build a payload for me that will succeed. All supporting organizations and individuals will of course be mentioned in all press releases, publications and in the show itself.

After some research you seem to be the ultimate specialist on balloon borne video. I hope that you are interested in collaborating on BIN for Willis. I can send you a much more detailed description of the project, I just did not want to load this first email with too much information. I am also very curious to see the video results of all those balloon launches that you already did, I might even want to use them in the show. Since December is close and time is running out I would appreciate if you could get back to me

at your earliest convenience.

Many thanks!
Regards,

Nin Brudermann

I had no idea they were causing a sonic boom when
bursting. I can see OSHA intervening here soon.
Sooo.... is the sonic boom loudness proportional to the size
or mass of the object moving 750+ mph?
Hmmmm...can we achieve Mach 2 or greater from a bursing balloon ;-)

Interesting question. Does a fully-filled large balloon burst louder
than a fully-filled small balloon? I'd like to know how they
determined the latex skin is moving faster than sound at burst. I
imagine a strobe would show that. A sonic boom has a double-
wing appearance on a seismograph. I wonder if it can be seen in a
audiograph?

I did find their comment on frozen balloons shreading into spaghetti
interesting.

> Hmmmm...can we achieve Mach 2 or greater from a bursing balloon ;-)

Let's see,
If we can force the burst to occur at the bottom of the balloon........

Topic: 5083 Message: 5083

Hi all,

We just had our FRR (Flight Readiness Review) meeting and decided to postpone the flight due to unfavorable winds. The jetstream would carry the capsule over 100 miles away making it difficult to chase and difficult to select a good landing area. We will meet again next Thursday to decide on a flight for the 23rd.

Topic: 5085 Message: 5085

Hi everybody,

I don't know if Paul already told you guys about my project. I am a video artist and for my recent project I am seeking collaboration with ATV balloon specialist. Basically this project is a documentary on the simultaneous global launch of weather balloons from remote islands. Mission BIN - Balloon in No Man's Land. There are static cameras on the ground filming the launch and there are cameras attached to the balloon, giving the balloons view.

Conceptually I am interested in this event as the only daily global event where all nations collaborate peacefully and that builds a global network, even to the remotest places on earth. This project will be presented in various international galleries and museums, and in a book published by Triton.

The islands I 'did' already are Jan Mayen in the North Atlantic/Arctic Ocean and the Subantarctic Kerguelen Group in the South Indian Ocean. In those cases I was using equipment that allowed a transmission of up to half a mile. My next destination beginning of December will be Willis Island, Australia and after that the French Antarctica. For those two flights I want to use technology that will transmit the video signal much further, ideally even to the stratospheric point when the balloon finally bursts. To achieve that I need your help. Can you build a payload for me that will succeed? All supporting organizations and individuals are of course being credited in all press releases, publications and in the show itself.

Paul told me that you would have to do a few tests on a microwave video transmitter. I heard that you are having a flight scheduled this weekend, but it's too late to run that test on that flight. Is it totally too late? Is there any other chance to get me this thing together until the end of this month? Or do you know anybody in the New York area who could help me with that, maybe remotely supervised by the TVNSP?

I hope you are all enthusiastic about my project - do you know The Red Balloon by A. Lamorisse... The revolte of all captive balloons... My budget is little, it's a non profit budget, the trip to all the islands I go to are sponsored by local meteorological organizations.

Who ever is interested in more information, I'd be happy to send you some detailed description, images, etc.

Thanks!
Nin Brudermann

5086. Leonids

Here's a website on Space.com that discusses listening to the
Leonids over radio.

http://www.space.com/spacewatch/leonids_spacewatch_021115.ht
ml

Watch for the split in the URL.

We discussed it shortly last night at the meeting, but we'd like to
set up some place to watch the show. I'm hoping most of us can
make it out to see the shower. If you have a thermos, bring it, it
should be cold Monday night, Tuesday morning. I'll look up the
best time to see the shower, but it will be after midnight, as I recall.

If you have recommendations for watching the shower, please
share them. Udeally, the location will be away from city lights, but
not an accessively long drive. I recommend Murphy, at the
trailhead for Rabbit Creek. Bogus Basin will proably have too many
lights (and snow).

Paul

5087. Leonids, pt 2

Yahoo group: tvnsp (2000 — 2002)

I have permission to hold BS2 lesson in my classroom. The plan is to hold classes on the Saturdays of January.

Please have, or arrange to use, a BS2 carrier board and bread board, or a BOE board. You'll need a series of resistors, wires, and LEDs. I'll draw up a more definitive list of components in the next couple of days.

Visitors will sign in at the door before proceeding to my classroom. The front door is locked, so someone will have to be wating at the door. There are pop and snack machines in the building, along with a restroom.

Paul

I use to fly 1W ATV back in 1997. I never found the videos as good
as sending a camcorder up. I want to experiment with 2.4GHz
video transmitters, as they don't need a license, which is what
Nin's limitation will be. Plus, the capsule needs to be
disposalable, so there's no need to send APRS up on it either.

From: Craig Brunson
Topic: 5071 Message: 5094

Randy-

I don't know what the record for us is. This is the fastest that I have seen in the last 3 years. This same group hit 103 mph last year on a flight from here to Klamath Falls. This customer was the National Center for Atmospheric Research (NCAR) out of Boulder, CO. They have 3 or 4 more flights after the first of the year & either want to launch from Hawaii, Guam, or Midway. We have a site at Southpoint in Hawaii that we launch NASA JPL balloons from.

This one did land by Wilder, Idaho, according to the NCAR web page data.

The boss doesn't like others watching over our shoulder, so to speak, & won't let us give out the gov. freq. being used. He & a couple of others flew the tracking plane to Boise & tracked it from the airport there. I assume they rented a vehicle & drove back to pick it up. Today is my day off & I haven't heard if it is back in Tillamook. I had my home system on & tracked it to north of Madras with the antenna pointed SSE from Hillsboro. It was down before I returned home to change the antenna. I am working with Keith Sproul and another ham on an interface for controlling a rotor to track the balloons.

I do track some of your balloon flights from over here. The biggest problem I had the last two flights was I was gone & my PC memory was full before the flight. I have a track, but no data stored on WinAPRS. I wanted to use AFilter on Rf to help, but it doesn't work on Rf. I am now looking into UI-view to see if that will help me.

Wow
Is that a record balloon speed for your equipment Craig?
Are you saying Wilder,Idaho. Wished we had known about
it? Guess no APRS tracker for us amateurs to watch eh?

What a cool job you have. tnx for info.

regards,

Randy

Pete Sias' SSOK mission January, 2000 (the unintentional floater) hit 175kts at 116kft (201mph). See http://users.crosspaths.net/wallio/SSOK_DRL.html and then http://users.crosspaths.net/wallio/ssokmavb.gif.

Mean Zonal Winds tells us that upper level winds peak in November and December. See table in http://users.crosspaths.net/~wallio/MZW.html.

Craig

That would be neat to have the APRS programs track with rotor control.
I think APRStk (dos version) does this,but the maps are not to cool.
I think it works off the parallel port hooked to an inexpensive rotor.

I use APRS+SA for two reasons. One,the program is very stable.
Have run it for weeks with no memory problems
at all. Second i like the map detail the companion program
Street Atlas provides. I have used all three programs and
have pretty much settled on APRS+.

I have heard that UI-view is pretty robust now with the addition of Prescison
Mapping. I need to look at it too. I don't really need
a fourth registered APRS program,but having the latest and
greatest is always fun.

Keep us posted on your findings. And beg your boss to let us watch.

regards,

Randy

5097. Deluo GPS review

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-11-15 20:30:59 UTC
From: Randy Farley
Topic: 5097 Message: 5097

Here is new post from the national APRS sig.
Mike is the author of Pocetaprs for PDA's

With a tip of the hat to Allan Sadowski, AH6LS, I purchased a Deluo GPS. It arrived yesterday and has already been tested, and taken apart and reassembled two or three times.

I like this GPS, and as part of a larger GPS project have put together a web page with a small review and technical details about it. If you're interested in details of a cheap but still good GPS, take a look at:

http://www.pocketaprs.com/gps.html

This page is incomplete, but the Deluo information is largely there and should be a passable reference for it in the interim.

Dan, the general direction is east, but this changes as highs and lows move through the area. The link that Ralph posted yesterday about Mean Zonal Winds was very informative about average winds on a monthly basis, but the discussion focused on speed because these trends are more apparent.

I guess I'm thinking of a few of the launches I know of and was in
on. The Rome Oregon to Caldwell. Jeffs Bruneau Dunes to Stanley.
These were largly Northerly flights.

Date: 2002-11-17 16:55:50 UTC
From: John Knapp
Topic: 5098 Message: 5102

The Rome to Caldwell and the Bruneau Dunes to Pine
(not Stanely) were not the norm. We have had flights
that have been nne, E, sse. I have done trial
predictions that have had the winds heading other
directions as well. A lot depends on the Jet stream
since we go through it twice, and also on the ground
level winds and winds above the Jet stream. A shear
wind (winds going in different directions opposite of
each other) will also affect balloon flight.

Hope this helps a little.

Thanks for the input KMC and Jeff.
I have been looking at the Parallax site.

I also have d/l the BS editor v1.33, but it
doesn't look like it will work with the BS1.
I d/l the BS1 DOS editor and it crashes my PC.
Is there another editor for the BS1 that works
in Windows?

Thanks!
Harry

5107. Leonids

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-11-18 14:42:48 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 4945 Message: 5107

The Leonids will be at their best around 3:30 AM tonight (tomorrow morning). I plan to drive to Murphy to see them, and hope to be there around 2:30 AM. I'll set up at the Rabbit Creek Trailhead. Email me or give me a call 631-7162 if you plan to see the shower. I'll be on the repeater as I drive out. If it's cloudy, I'll try Bogus Basin instead.

To listen to them, tune your FM radio to a clear frequency below 91.0 MHz. Distant stations will come in as their signal bounces off the meteor's ionization trail.

Hope to see you there,
Paul

5108. DJ-S11 Mods and PCBs

We need the following items to modify the DJ-S11 on 14 Dec,

Coax-Style DC Power Plug (4.0 mm X 1.7mm)
Radio Shack #274-1532

Toggle Switch (SPST)
Radio Shack # 275-612 or 613

Barrel Connector for BNCs

Coax Cable from Jameco (I have one spare)
#11404

Anderson Power Pole Connectors
We can splt a bag from Current Source (let me know if I need to
buy a bag)

Smallest wire clamps available at Radio Shack (for 1/8" wire)

I'll bring square tubes and wire for the antennas

Please bring hot glue, heat shrink tubing for coax, and jeweler's
screwdrivers

**********8

I have the following PCBs

MIM-based flight computer
Tiny Tracker (I put one together from spares)
Radio beacon
Three temp arrays
FTU

5109. T-shirt

5115. Christmas Party

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-11-19 05:05:58 UTC
From: John Knapp
Topic: 5108 Message: 5115

John and I are going to hold a TVNSP Christmas potluck/work party on Saturday December 14th.

We would like all tvnsp members and spouses/guests to attend. For those who are going to be working on the DJ-S11 modifications, that will start at 2pm. The guys know what they are to bring for their projects. If you are not working on a project, but want to just come for dinner be here about 5. If the spouse/guest is coming with the working person, that is fine also. I will be here.

I would like to have an RSVP by December 2nd to make sure we have seating available for everyone. I am asking everyone coming to bring a main dish, and then when I get their rsvp I will email back whether they are to bring an salad or a desert. I will alternate these as the rsvp's come in so we will make sure and have plenty of goodies.

We will furnish the plates, cups, etc, and also will have a very good punch for everyone.

We are looking forward to having everyone here, and think it will be a very fun evening. It will give everyone a chance to meet others that haven't been involved with launches and chases and maybe will get some more interested in the fun of near space. John will monitor the 24 repeater to help people find the house if necessary.

I can be reached at my email debdk@...

Directions to our house will be available for those who need them. PS. Just look for all the Christmas lights. :)

John and Deb Knapp

5117. MIM

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-11-19 14:35:28 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 3492 Message: 5117

I ran a test during class yesterday. I wanted my students to practice with the o'scope, but I ended up doing most of the work myself (why let the kids have all the fun).

When the MIM transmits, the waveform it generates is almost a pure DC with a tiny AC ripple on top. I adjusted the tiny pot on the board until I got a clean sine wave. There's only about 60 degrees of good adjustment on the pot. When I adjust the pot within this range, there is no chnage in sinewave amplitute, as I would expect. I emailed Dr. Twiggs at Stanford about this.

Last night and this morning the MIM was sending packets that my Baycom TNC could decode. When the MIM was programmed to transmit at two second intervals, I had about 100% packet decodes. When I dropped the the rate to once a minute, the decode rate was closer to 90-95% decodes.

There's about a 3-4% error in the telemetry values. I need to test and verify the error is consistent across a ranage of voltages. If so, I'll add a correction to the spreadsheet used to analyze telemetry data. I've asked Dr. Twiggs about this error.

Both modules are ready to go up on our next launch. I guess it's time to start making predictions.

Paul

5118. internal payload antenna

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-11-19 15:01:15 UTC
From: K. Mark Caviezel
Topic: 5118 Message: 5118

All:
one possibility for the new DJ-S11 you guys ar
modifying - stay with the stock rubber duck antenna.
Now, I know it's the worlds crappiest antenna, but
rubber ducks (particularly if they are taped on) can
be a high reliability package. My favorite tracker
has a radio shack HTX-200, garmin etrex, and TT2, and
9 V battery all completely enclosed in a styrofoam
sandwich which slips into a custom sewn ripstop nylon
bag. A very similar package, with the HTX-400 radio,
few on the balloon bag for the EOSS 59 flight....
Although the TT needed a little more capacitive
coupling to 'speak clearly' through the HT, the
package did send out APRS that was copyable at 80
miles range. Just food for thought. And YES the
HT does degrade the GPS reception as they are 4"
apart, but it's a very modest effect, and the HT
transmits about one second per minute, and during that
second, the satellite signal strength indicators on
the GPS decrease about 15%, so there is no affect on
tracker performance.

I've seen a couple payloads go silent because of bad
antenna connections..... you may want to consider this
for a higher reliability option.

Paul,

Did you get to see any Leonids? I tried giving you and Mike a call around 3:45am on the .24 but got nothing. I did chat with Dave, KG7CN, on my way to work as he was looking for the Leonids also. I couldn't see anything from my vantage point, just a thick blanket of stratus clouds.

5121. Prediction for Saturday

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-11-19 17:41:25 UTC
From: John Knapp
Topic: 5108 Message: 5121

I have run a predition this morning for the Saturday launch:

Bearing: 168 degrees
Flight time: 138 minutes
Range: 63 miles.

I did alter the dat file to include winds above 85,000 ft. I had basically the same predition yesterday without using the winds aloft. Max. wind is 64 mph at 30,500 ft and direction of 7 degrees.

5122. Re: [tvnsp] Re: Leonids

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-11-19 17:48:50 UTC
From: Harry M
Topic: 4945 Message: 5122

I was awaken at 2:30 by the sound of Valery Korzun the ISS Russian Commander on the radio. I failed to make contact with him to ask if he was watching. He was in a QSO with another station and there was no mention of the Leonids. I looked out the back door for about 5 minutes and Saw nothing! Got up at 5:30 for a great visible pass of the ISS and there were quite a few meteors then, even with the city lights and the morning light approaching. I took a time exposure of the ISS, but I don't think any meteors got in the frame

Looks like 4-6am CST was the best time here in Tulsa.

YAWN!!!

I've used this mod to attach an external 2m dipole to the HT. The signal seems fine. Perhaps we ought to get a signal strength tester out.

Does anyone have one?

To: hiscock@..., VERHAP@...
From: David Atkinson <atkinson@...>
Subject: Balloon questions

Hi Paul and Bill,

We are beginning to think about a possible UI payload as part of the
proposed balloon flight in April. We would like to fly something simple,
but something that we can get some Idaho engineering students involved in
designing, building, testing, packaging, etc. A couple of questions -

Paul - you had said that you can measure up to 6 voltages (0 to 4.096
volts). Can you give me any more details about data rates, if you have
power available or if we need to provide our own power, etc. Also - would
you mind if one of our team leaders contacted you by email for some
questions as we prepare for the April flight? To the extent that we need
to interface with you regarding power and data, as well as the overall
parameters of size and mass, we want to make sure we are building something
that can be easily "plugged in" without any electrical or mechanical issues.

Also, if either of you have some ideas on something that would be fun to
fly and not terribly risky or difficult to build for undergraduate
engineering students, please let us know. John Ophus (from UI who attended
the Boulder meeting last summer) has his instrument description from the
workshop, but we are looking for other ideas as well.

Finally, what is our timeline here? It has been suggested and I think it is
likely that we will need to go to central Washington to launch, given the
easterly winds. When do we need to make a decision on where to launch and
what other arrangements do we need to make - (e.g., with the FAA to notify
them of the launch), etc. If there is any advance planning to be done, let
me know what we should be doing and when it needs to be done.

Thanks.

Dave

5126. ATVQ Article

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-11-19 19:52:08 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 5126 Message: 5126

I hear the latest ATV Quarterly is out. There's an article on GPSL 2002 in it. I believe that's the one I wrote. As soon as I get a copy, I'll let everyone know.

As far as I'm aware, no one here subscribes to the magazine. Now that APRS use is beginning to pick up in Idaho, perhaps we ought to look at making ATV more popular.

This also reminds me.
<soap box>
I'd like to see TVNSP write more articles for ATV Q. We probably have more collective knowledge in a smaller group than any other near space group. I'd like to see us share that knowledge.
Besides, writing has its benefits, like $25 per article. For a couple hours of work, you could have a nice dinner out.
</soap box>

We will be unavailable on the first weekend of April,
that is the same weekend of the Boy Scout Willow Creek
competition. I was hoping that we could have a setup
like we did two years ago. Also, the SNARC hamfest is
scheduled for April 26.

5129. RE: [tvnsp] Prediction for Saturday

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-11-20 03:44:35 UTC
From: K7JPS - John
Topic: 5108 Message: 5129

I ran a prediction this evening. The MRF model showed that the "current" winds were from 19 Nov 0Z (more then 24 hrs ago). Modifying the winds above 87000 ft with the current Boise sounding (20 Nov 0z), I came up with

Bearing: 170 Degrees
Range: 62 miles
Flight time: 138 minutes

This looks like John and I were using the same data up to 87000 ft. The AVN and ETA models are not quite within range yet.

Hey all,

I'm afraid I can't make it to the FRR tomorrow, but I'd like to
go to the launch on saturday if it's still on (and if that's
alright).

So, could someone email me (david@...) or post
on here the info about that after the meeting tomorrow?

thanks!

David

5134. Saturday Predictions

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-11-21 05:30:58 UTC
From: DEBRA S FORMOLO
Topic: 5134 Message: 5134
Attachments: 1 described; binary payloads are missing from this source WARC

Group,

I hope I'm doing this right. I ran my own prediction using the University of Wyoming data for Nov 21 00z. I came up with four results, using burst alt. at 95, 98, 100, and 105k. I don't even get past 30 miles range while both Johns are getting 60+ miles. I even overlayed the data on a map using Bully Crk as launch. I'm also using ascent of 1000 and descent of 1200. Is this correct?

Justin

I recall a phone call I recieved this weekend from Glenn of VOI.

We need to pass the information out over the repeater. Not
everyone interested in the launches has email.

John the Younger, can you put that on your FRR checklist?

Paul

> this correct?

Use a burst of 100,000 feet. The ascent and descent rates are
good. We're using the same balloon as last time and three pounds
of positive lift (free lift).

I tested the MIM again last night. It worked well, but the voltages
returned in telemetry were acting up. Jeff, can you spare a
Thermochron for Saturday's launch?

Can Stephanie, Norma, and Randy make the launch?

Paul

Using the UWyo data as noted would show you what a flight would do if launched at 00Z on the 21st. You'll need to use a forecast for Saturday morning's winds from http://gus.arlhq.noaa.gov/ready-bin/quickprof.pl to show what a Saturday flight will do.

Someday I'll get a why-and-how-to written up and posted on the web.

5138. Today's Flight Prediction

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-11-21 14:52:07 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 5138 Message: 5138

Using today's winds out of Boise (I didn't book mark the more advanced site) the balloon would land 27 miles away at a heading of 101 degrees. I can't get to the MRF site to see how the winds aloft are changing over the next couple of days.

since we are unseasonably warm, the jet stream should be to our north. The weather is not predicted to cool down until after Saturday, so the jet should stay to our north for the launch.

What could be better? Warmer mornings and a short chase.

Let's plan to launch around 8:00 AM.

See you at tonight's FRR.

Paul

5139. Re: [tvnsp] Today's Flight Prediction

Topic: 5138 Message: 5139

Ihaven't done today's prediction yet, but yesterday, modifing the data file on balloon track above 85,000ft, and using and avn model forcast model, I had the following:

Flight time 138 minutes
Bearing: 114 degrees
Range: 47 miles.

This afternoon I will do the same as I did last week, with predicted balloon flights from several locations. One thing I have noticed is a constantly changing forcast for Saturday, Monday the winds were predicted to be going almost straight south. They have been slowly swinging to the east.

I will send out more as I can

Justin, if you check your winds, you will find the
data ends at about 85,000 ft. That may be why your
range is a little short. If you are at the meeting
tonight either JohnS or I will show you how to
compensate for the problem.

Have you transmitted live ATV on any of your flights before? I
understand TVNSP captures still photos and occasionally records
video. Live ATV would be interesting.

Francis (W7HDI) presented his video camera and microwave transmitter
at
the September VOI meeting. I was thinking at the time, "Gee, I wonder
if TVNSP has transmitted live video during flight." Might this be the
video system Paul's referring to?

I spoke briefly with John (K7JPS) about ATV at the last VOI meeting,
and this sounds like something you might consider for a future
launch? Does it pose any major technical difficulties?

Thanks,

Mike, W7MJR

5159. TV02H is a GO for launch!

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-11-22 07:37:38 UTC
From: Mike Garske
Topic: 5159 Message: 5159

Group,

TV02H will launch on Saturday, November 23rd at 7:30am MST. The launch location is Rabbit Creek Trailhead located about 2 miles north of the town of Murphy. The preliminary landing predictions puts it near Bruneau as of Thursday afternoon's ETA model.
Launch preparations will promptly start at 6:30am. Current flight profile predicts a 100,000+ ft flight, and it will have a camera on board. If all goes well, we should have some spectacular pictures to check out!
If anyone is interested in coming out to the flight to watch and/or chase and needs directions or wants to follow one of us out to the launch site, let us know by responding to this email by tomorrow night. Hope to see everyone's smiling sunshiny face EARLY Saturday morning!

Just a friendly reminder....dress warm and be prepared for any hiking...it is a distinct possibility this weekend! Water, snacks, and some good sturdy hiking boots are the bare minimum for the hike. One more thing, be prepared to have fun!

Mike KC7DPD

I've send ATV on my KNSP flights. With a one watt signal and a
small yagi on the ground, the quality of the signal was not great.
That's why I went to camcorders.

> Francis (W7HDI) presented his video camera and microwave transmitter
> at

> if TVNSP has transmitted live video during flight." Might this be the
> video system Paul's referring to?

Francis has a dish antenna for the ground station. With that extra
gain, ATV might be more feasible.

> I spoke briefly with John (K7JPS) about ATV at the last VOI meeting,
> and this sounds like something you might consider for a future
> launch? Does it pose any major technical difficulties?

I don't know if there will be challenges. But the way to find out is to
launch more balloons!

Paul

5163. I-Gate?

Paul,

You shouldn't have any trouble hitting an I-gate. Stephanie's QTH is our local internet gate. As long as you hit CNABAR and onto LIME digi's OR Stephanies QTH directly, everything should pass on to the internet.

Stephanie runs one 24/7.

You probably did not hit a digi.
I can barely hit one with the squeaky DJ-11
at my QTH. I Usually have to set my base stations
Alias to WIDE temporarily for it to get out in my testing.

Hi all,
I ran a prediction this morning after work using the new method John showed me. I used this mornings BOI data and NOAA predicted data for +24hrs. Here's what I got.

Range: 31 miles
Bearing: 112.5 d
Time: 138.9 min

On the map, the landing is NW of Grand View, right were HWY 67 turns sharply south towards the river. There MIGHT be a chance that touchdown my swing more towards the east as time progresses, puting it in Military Maneauvering territory. I'll do a prediction later this afternoon and evening. Can't wait to see what both Johns got.

It looks like W7MJR is running an IGate over in east Boise also.
Looking at the packets from my QTH I see a mix between his and
Stephanie's IGates for which handled it first.

It doesn't look like I'll be able to make the chase so I'll check to
make sure there's a working IGate in the area and bring mine up if
needed. (It shouldn't be necessary.) Besides, once the balloon is in
the air it'll likely be hitting the SLC IGates as well.

What call signs will the capsules be using? KD4STH-11 and ???

Bill

I just ran the predictions also. I agree with Justin's idea of a touch down. Also, I ran a predition for 95,000 ft. The touchdown was just west of Mt Home Air force base. Not a good thing. Also the landing area for 105,000 ft is only several miles from CJ Strike. We may want to consider changing the launch site, move it more to the west.

Any ideas from the group?

Group,

How about we get on the 147.240 repeater and discuss or announce any changes to the launch tonight, if there is any? Say around 7:00 or 8:00pm? Any objections? That way after tonights soundings come out we can have a better picture about tomorrow. Plus, it might get some more people interested who might be listening.

More west?
How about Homedale or Kuna, which adds a northernly component
to the touch down location.

I will be listening and running more predictions
between 7 and 8. Talk to you then.

I have run some preditions for the lot across the
street from Randy's house. The landing is in a circle
about 8 miles in diameter with Pearl in the center.
Homedale might also be a good alternative. Haven't
done Bully Creek yet.

5179. TV02H Launch Site Change

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-11-23 04:49:23 UTC
From: Mike Garske
Topic: 5179 Message: 5179

Group,

It has been decided that we will meet at the Homedale Airport at 8:00am tomorrow. We will wait for the current soundings from the Boise Airport to make the final launch decision. Right now the winds are shifting from out of the Southwest to the Northwest, and we want to make sure this transition is complete before we launch. We hope to be landing in the Orchard area between Boise and Mountain Home, South of Interstate 84.

****Directions to Homedale Airport****

Take I-84 West to Exit 27, Take to State Route 19 to Highway 95. Take a left on Hwy 95, this will take you to Homedale. The airport is on the right hand side just after you cross the Snake River bridge, so keep a sharp eye out for it. If these directions are still unclear David, you can call me in the morning before 7am, my phone number is 846-9219.

Mike Garske KC7DPD

I don't have the exact location, but if launched from
Homedale the casules should land south of Owyhee and
west of Orchard. This is north west of the Orchard
Training area.

I had:

Bearing: 119 degrees
Range: 41 miles
Time of Flight: 133 minutes.

I did try to call you on the radio, there was no
answer.

Bill,

It is a bit complicated if you haven't done it before, but here are some clues on how I did it. Download the ETA model as text, run it through Balloon Track. Baltrak will create a profile with these numbers. Remember where this Profile is kept, then run the latest sounding (12Z), and find this file that Baltrak will create. The ETA model only goes to 60,000 feet, so you have to cut and paste the 12Z soundings results from 60k on up into the ETA profile. Once these are combined, you have to change 2 numbers at the very top of this Profile to the number of lines of data you now have. These are the LAST two numbers, they will be separated by commas. Once you have done that you can force a recalculation with balloon track and you should come up with:

43.3 miles, 122.2 bearing. This is using 105k for the burst, 1000 ascent, 1200 descent from the Homedale airport

Hope this helps, I watched John KD7HGS do it tonight, then I figured it out just now.....looks like it worked!

Thanks - that got me there, however, I'm not sure how much faith I have in the result. (I checked the wind profile that balloon track had and I believe they match the data I fed it - however, the number of data points in the predicted data set is much less than the same altitude range in the actual sounding data.)

>Hope this helps, I watched John KD7HGS do it tonight, then I figured it out
>just now.....looks like it worked!

Geez! Talk about an error waiting to happen. I'm not going to tackle it tonight but we need a data validator for Balloon Track wind profiles.

Boy am I glad that I'll be running the prediction with actual soundings tomorrow morning!

Sorry to hear that. Remember that you can follow mission progress on the web. At the bottom of the page at www.tvnsp.org there is a link to kd4sth-11 and kd4sth-10 both of these will take you to maps that refresh every three minutes with the latest location information.

John

Just a thought David - I'm only able to be here on the net control end till launch time. They could probably use somebody to watch over them from this end.

Bill

5190. TV02H Update

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-11-23 16:04:31 UTC
From: Bill Herrmann
Topic: 5171 Message: 5190

They've moved the launch site slightly. They'll be launching from near Homedale High School.

Approximate launch location is:
43.61786 -116.92921 at 2235 feet

Predictions show the wind turning south so we're predicting a flight path between 113 degrees and 138 degrees.

Right now they expect to launch around 0930 local.

Bill

p.s. Capsule callsigns are KD4STH-10 and KD4STH-11

5191. TV02H Update 2

Got an update from John:

They've moved the launch site slightly. They'll be launching from near
Homedale High School.

Launch location is:
43.61879 -116.92963 at 2238 feet

They expect to be ready to launch by 0930 local but may hold till 1000 just
to let the winds turn a little more south.

Bill

p.s. Capsule callsigns are KD4STH-10 and KD4STH-11

Boy, my predictions are jumping all over the place.
I can't get the current soundings out of Wyoming, and getting them
from Ohio State shows 1 corrupt reading but puts the landing in
downtown Boise! So after some number crunching here
is my prediction for a landing.......N43.0935 W116.1498

Tell Paul to aim for that spot!

Attached is a simple text file that contains the data I was able to capture. I never saw KD4STH-10 at all, only KD4STH-11.

I will be very interested in hearing about the chase and retrieval. I know the area where it came down, so I'm really interested in hearing how the chase went, what roads it took.

Something that came to me as I was tracking it at home (previous commitment was cancelled just before I was to leave for it, so tracked TV02H from home instead). Situations like this, it would be very useful to be able to see where things are going, not only the balloons, but also the trackers. Case in point: from my maps here I could have contacted one of the chase teams to advise them that they needed to take a certain road, otherwise they would be dead-ended, or to recommend running for the bridge at Grandview rather than turning and going for Walter's Ferry as you had a more direct path there. The problem here is, I had no idea what calls to monitor for the chase teams.

As a result, I would like to propose adding one more item to the checklist gone over at the meeting before launch day. I recommend that you add tactical calls in a similar manner to that we use with the Women's Challenge. All chase vehicles running APRS set their MYCALL to a tactical call such as TV02H1 (probably Paul! ;-), TV02H2, etc. and have the posit text include your actual call. That way, one can look at the map or call list or whatever and know instantly what the chase vehicles are to track, and could then either contact via voice or APRS one-liner using either the actual call or the tactical call. This would also allow those of us tracking it from here to collect and log the paths of the chasers to analyze and help discover more efficient ways to chase the balloon.

An example of this is, once you got past Walters Ferry, what provision was there for the balloon coming down on either side of the Snake? There's not that much opportunity to cross the river, and with the balloon following the Snake so closely, chasers on both sides might have been useful, maybe most on one side that the balloon was apparently heading to, but at least one on the other side?

One last, slightly humorous observation: loking at the path as shown on my map, I'm seeing that TV02H apparently noticed CJ Strike from up high and decided to make a beeline for that instead of Murphy! ;-)

I have attached my SA9 map with points from FindU.
I didn't start adding points & alt. until -11 was
south of Marsing. I was not getting frequent FindU
updates on -10. Last I saw it was at 85K, and that
was 45 min old.

On the map are three prediction lines. One went east
toward Boise and the other two SE. The balloons
followed the last prediction (red), except the down
range distance was shorter. i just looked at the 1800
Quick Sounding and it is a lot closer.

This position at about 3500 feet would have been no more
than 1000 feet above ground level, so it should be pretty
close to the final resting spot.

Here is my SA9 map with the flight path in Blue and the predicted path I had before launch in Red using forecast winds. I never did manage to get the 12z soundings from Wyoming!

Other than not showing the curly cues that the flight was making as it neared burst, the general path came out darned close to the actual! Now how is THAT for luck? I used 100k for a burst altitude, and 1000fpm for ascent and 1500fpm for descent.

I wanted to follow the flight live on the internet rather than find-u.com, but couldn't seem to figure out why APRS wouldn't work right. Well, now after several hours of playing, reloading, and cussing, found the problem. More operator error than anything. I had made mop files for my tracking maps, and their presence made the maps behave to their settings and not the ones I was entering manually. They would not even allow me to load the text logging files. So, learned something new!

Hi Hank,

We can always tell people we did it on purpose! We were
surveying the river. Yah, that's it!
Everyone was talking about it landing on one side or the
other. It could have split the difference, then we wouldn't
need to worry about what side we were on.

Topic: 5195 Message: 5207

From the -10 capsule, I have a max altitude of 85,062 feet and from the -11 capsule I have an altitude of 85,129 feet. I think Tim is looking at the same packet, but I used a conversion factor of 3.28.

Picture 20 was taken at 82,701 feet and picture 21 was taken at 2,853 feet. The reason one picture was taken during the ascent is because so many photos were taken before launch. I have the flight computer calculate when to take a photograph. with eight photos before launch, the ninth is calculted to take place at 82,000 feet. It looks like the reason so many photos were taken before launch is because my preflight routine didn't set a variable to teh correct value before returning to the flight routine.

The one photo during descent is still a puzzle. Photos are programmed to be taken once the capsule drops below 6,000 feet. It may be that the capsule descented fast enough that it missed taking a photo higher than 2,800 feet.

The temperature data was blank. I need to look at the experiment and make sure it wasn't unplugged before launch. The main power voltage dropped as the temperature did and came back up again as the capsule interior warmed back up.

Paul

5208. TV02H sighting SE Boise

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-11-24 20:54:57 UTC
From: Mike Rogers
Topic: 5208 Message: 5208

I had a brief but beautiful view of TV02H through binoculars due west of my SE Boise location. TV02H was at about 35K ft and 30 mile range and had just come over the low lying morning haze. I lost track of it after I raced back to the house excited to tell my girlfriend about the sighting --- 'should have at least given a quick report on "24" since I was carrying my ht.

We tried finding it again later using the approximate altitude and azimuth based on the aprs positional data --- to no avail. TV02H was drifting eastwardly across the southern sky and back into the haze and glare of the sun --- and the trees across the street. This was my first deliberate high latitude balloon sighting. I'm sure visual tracking skills come with practice, but I'm pretty hyped about spotting it from that distance. Coincidentally, the launch was within several degrees of due west of my qth and the landing was practically due south.

Yes, I was surprise to see it and to make out it was a balloon. The position of the sun relative to me and the balloon worked to my advantage. Just out of curiosity, what is the approximate diameter of the balloon near 35,000 ft? I'd like to calculate the apparent diameter.

Are these balloons all made the same material (latex?) and light in color with fairly good reflectivity? And does the shape change much as it expands --- say from oblong to round --- or does it maintain some basic shape throughout the ascent?

I look forward to the next flight (probably next year?).

Thanks,

Mike, W7MJR

I did a very rough calculation and got an angular diameter of about 20". This is twice the apparent diameter of Venus at superior conjunction (full phase but farthest from earth). So, the balloon's angular diameter was on the order of the Venusian disk. This makes sense because what I saw in the binoculars was a whitish luminous disk. It didn't really shine like a star, and it was extremely difficult to make out with the naked eye. I watched it long enough to note it's movement in the right direction to be TV02H (or ET). It was at that point I got excited I rushed back to the house to "share" and lost track of it. I suppose it could have been an on coming aircraft, but I don't like to think so :)

I was poking around on the KNSP web site looking for ATV flight information and ran across this spectacular video footage of the Flight 98B balloon burst (with sound) at 98,400 feet. Anyone who hasn't seen this video needs to now (Quicktime movie): http://www.ksu.edu/humec/knsp/images/98b.mov .

I noticed one KNSP flight (97C) with ATV which suffered antenna damage at launch. However, there's a number of great video recordings and SSTV images from many of the KNSP flights. Were there any other ATV flights besides 97C?

Didn't Francis have a 23 or 13 cm antenna? It seems you would want to use 70 cm for maximum range and signal strength (@ 1-2W) and use one or two strategically placed ground stations with preamps and maybe high gain Yagis or even phased arrays, e.g. two phased 10-11 element beams with a good GaAs preamp mounted to a heavy-duty tripod? (I have no ATV experience, but I have a feeling this might be changing.)

Is there an ATV community here in the Treasure Valley? I haven't heard of any local ATV repeaters (there's one on Mt. Harrison) although I'm new to amateur radio and haven't made many contacts. Also, would you want the audio transmission along with the video, i.e. is it worth the extra circuitry and weight?

Maybe someone with a local 70 cm EME system might be interested in being an ATV ground station too? Broadcasting the live signal on the amateur band and on the internet would make ATV more engaging to the spectators and crew alike. I can't think of any scientific benefit of ATV aside from the technical challenge. You'd always want to tape the video anyway.

Mike, W7MJR

I've send ATV on my KNSP flights. With a one watt signal and a
small yagi on the ground, the quality of the signal was not great.
That's why I went to camcorders.

> Francis (W7HDI) presented his video camera and microwave transmitter

Francis has a dish antenna for the ground station. With that extra
gain, ATV might be more feasible.

> I spoke briefly with John (K7JPS) about ATV at the last VOI meeting,

> launch? Does it pose any major technical difficulties?

I don't know if there will be challenges. But the way to find out is to
launch more balloons!

Paul

Mike,

I can't be sure what the diameter was at 35,000 ft but the projected burst diameter is approximately 31 feet and the expected altitude was 100,000 ft. On the ground it is about 8 feet in diameter.

These numbers are a rough guess using Hank Riley's Lift Win Program. We used a Kaysam 1500 gram balloon. Hank's program does not yet include that balloon but does have a Kaymont 1500 gram balloon. Our payload was about 12.5 pounds and the free lift was about 3.5 pounds. We expected to be closer to 100,000 feet but it burst at about 85,000 feet. Not sure why. These things are not an exact science.

Thanks Jeff. I bet these "unknowns" help keep it interesting! I chose a 15 foot diameter and 30 mile line-of-sight for my calculation.

Mike,

Our group is lead by Paul Verhage who was the project manager for KNSP. Those capsule's you see on the home page are Paul's design and are the same design we use now (with some exceptions).

http://www.ksu.edu/humec/knsp/

Paul can answer your questions about those ATV flights. Unfortunately he only has access to the internet when he's at work.

It sounds like you have a strong interest in ATV and possibly combining it with ballooning. Perhaps you should join our adventure. If you build an ATV capsule we'll fly it. With the help you would get from our group it wouldn't be to difficult.

Paul has experience flying ATV when he was with KNSP but we have not yet tried that here. We fly picture camera's and a camcorder. We are not the first to fly a camcorder but are the first to get a couple of complete video's from lift off to landing. If you would like to see the video's they are available.

Since you are a member of VOI I was assume you know that TVNSP is a special interest group of VOI. We would like to see more people participate if your interested.

> Yes, I was surprise to see it and to make out it was a balloon. The position of the sun relative to me and the balloon worked to my advantage. Just out of curiosity, what is the approximate diameter of the balloon near 35,000 ft? I'd like to calculate the apparent diameter.

At 35,000 feet tne air pressure is approximately 1/4 of surface pressure (sea level). Therefore the volume has increased by a factor of 4. The diameter is the cube root of that times 7 feet, which was the initial diameter (roughly). That gives me 1.5 times 7, or about 10 feet across.

> Are these balloons all made the same material (latex?) and light in color with fairly good reflectivity? And does the shape change much as it expands --- say from oblong to round --- or does it maintain some basic shape throughout the ascent?

They're latex and they are off-white, almost a cream color. The balloon may not stretch as much at the base where it's constrained. This may account for why they tend to burst at the top.

Paul

at 98,400 feet. Anyone who hasn't seen this video needs to now (Quicktime movie):
http://www.ksu.edu/humec/knsp/images/98b.mov .

The video was from a camcorder. Bring a video tape to the
Christmas party can we can make a copy for you.

Jeff, can you bring your TV/VCR? I'll bring mine and we can dup
tapes for anyone missing one.

W7MJR, will you attend our Christmas party? It's on the 14th. At
it we'll mod some Alinco DJ-S11s for near space.

> I noticed one KNSP flight (97C) with ATV which suffered antenna damage at launch.
However, there's a number of great video recordings and SSTV images from many of the KNSP
flights.
Were there any other ATV flights besides 97C?

The first three of 1997 were ATV flights. In 1998 we started
sending SSTV with the Kenwood VC-H1.

> Didn't Francis have a 23 or 13 cm antenna? It seems you would want to use 70 cm for
maximum range
and signal strength (@ 1-2W) and use one or two strategically placed ground
stations with preamps and maybe high gain Yagis or even phased arrays, e.g. two phased
10-11 element beams
with a good GaAs preamp mounted to a heavy-duty tripod? (I have no ATV experience, but I
have a feeling this might be changing.)

I'm hoping to test 2.4 GHz frequencies. They don't require a
license and with a good dish on the ground, we may be good
reception at near space distances.

> Is there an ATV community here in the Treasure Valley? I haven't heard of any local ATV
repeaters
(there's one on Mt. Harrison) although I'm new to amateur radio and haven't made many
contacts.
Also, would you want the audio transmission along with the video, i.e. is it worth the
extra circuitry and weight?

None that I know of. I have ATV for near space, but to use it, we
need a ATV ready ground station (another job for mission control?)

Paul

We're not the first, but we are one of the only and as Jeff said, no
one has video from lift off to recovery like we do.

Paul

5222. TV02H Reports

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-11-25 15:09:10 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 5222 Message: 5222
Attachments: 4 described; binary payloads are missing from this source WARC

I want to thank outr Mission Control for this flight. There was one point at which we were on a road without a street sign. MC informed us we were on the right road at a time we needed to know that.

I'd also like to thank KNSP for their interest in the flight. I liked reading the KNSP commentary. It's a shame we can't get you on our repeater during the flight. Perhaps we should use HF on chase.

I'm attaching two spreadsheets from TV02H. The batteries one is the temperatures inside the -10 capsule according to the thermochrons. The top line is temperatures inside the battery loft or compartment. The bottom line is the temps inside a battery box. The battery box temperature should be warmer because of it's extra insulation. That was Jeff's t-chron. Jeff, didn't you say you had a problem with yout T-chron being accurate?

The other spreadsheet is TV02H. Notice on the descent speed graph how the initial change in descent speed is smooth, but once the capsule drops below 38,000 feet, there's a lot of variation in descent speed. Perhaps there as more rocking at low altitudes.

The interior temperature of the main capsule never dropped below 18 degrees and that only occurred for a few minutes during initial descent. We may be able to get away with alkalines on future flights.

The main battery voltage followed the drop in temperatures. The knee in the ascent is not noticable on this flight. But look along the edge of the graph and it looks like a faint knee occured at 40 minutes into the flight.

There's still more work to do ont he graphs, so enjoy.

Paul

I'm glad Tony N7MTZ was able to step in and help you out there. I felt bad having to cut out when I did. At least we were able to get some predicitions out to you. (I was able to listen to the audio end of most of the chase BTW.)

I think this points out the reason why we need to run trackers in the chase vehicles not just track the balloon. As Bill B. pointed out we need to include that information in the FRR and keep those tracks as well so that we can study how to improve our recovery efforts.

Bill

p.s. Anybody ready to comment on the recovery? So far I've only seen Dan's message that the capsules were recovered.

Mike,

Now right out of the box I have to admit I am NOT an expert, and I DON'T have access to all the things on the capsules. BUT, for there being almost 80,000 feet difference in the height the pictures were taken, the resolution, haze, etc. is virtually identical when I look at them! From 2853 feet the river should be considerably wider than just a line! (I compared this with photos taken from NSTAR 02-F which had many low altitude shots) So do we have an expert who can enlighten us?

We could see and hear the capsules on the side of the butte, from
about 1/2 mile away. It was a very pleasant stoll to the capsules.
One boom broke on landing, but it was at the epoxy joint, so it's
easy to fix.

I still need to unload the capsule and determine why some
experiments failed.

> Now right out of the box I have to admit I am NOT an expert, and I DON'T have access to all the things on the capsules. BUT, for there being almost 80,000 feet difference in the height the pictures were taken, the resolution, haze, etc. is virtually identical when I look at them! From
2853 feet the river should be considerably wider than just a line! (I compared this with photos taken from NSTAR 02-F which had many low altitude shots) So do we have an expert who can enlighten us?

I just reported the altitude according to the flight computer. John
and I will try locating the area photographed and then get the
altitude.

I need a list of ten things that it is recommended you not
photograph from near space. I'm looking for humorous items for
my book (I have four so far). I'll give credit for any items I put in the
book.

If you have something funny to add, please email me.

Paul

PS, the book has 378 pages as of today.

Paul,
The 85,150 altitude was what was reported by Winaprs. Not sure what conversion factor it uses.

Tim

Subject: [tvnsp] TV02H

From the -10 capsule, I have a max altitude of 85,062 feet and from the -11 capsule I have an altitude of 85,129 feet. I think Tim is looking at the same packet, but I used a conversion factor of 3.28.

Picture 20 was taken at 82,701 feet and picture 21 was taken at 2,853 feet. The reason one picture was taken during the ascent is because so many photos were taken before launch. I have the flight computer calculate when to take a photograph. with eight photos before launch, the ninth is calculted to take place at 82,000 feet. It looks like the reason so many photos were taken before launch is because my preflight routine didn't set a variable to teh correct value before returning to the flight routine.

The one photo during descent is still a puzzle. Photos are programmed to be taken once the capsule drops below 6,000 feet. It may be that the capsule descented fast enough that it missed taking a photo higher than 2,800 feet.

The temperature data was blank. I need to look at the experiment and make sure it wasn't unplugged before launch. The main power voltage dropped as the temperature did and came back up again as the capsule interior warmed back up.

Paul

The first photo that was supposed to be from 85,000 feet
is actually from much earlier in the ascent. I've indicated
where the balloon crossed over the Snake at Walter's Ferry.

At that point the balloon was about 44,000 feet high. That
puts the altiude for this picture somewhere between 40,000
and 50,000 feet.

The second photo might be a little more difficult to
conclusively identify.

Photo 1 allows for a pretty accurate measurement since those
Snake River Islands make distinct reference points.

Mark did find the correct kink in the river for photo 2.

On photo 2 I come up with a slightly smaller measurement
than he did for the span of the river in frame, however
photo 2 is still conclusively from a higher altitude than
photo 1.

The vertical scales are based on taking a simple ratio for
the measured spans, but this is only an approximation since
the first picture for sure and maybe the second one look
not straight down but slightly out towards the horizon.

Since the pictures are not pointing straight down it's not
possible to say when each was taken, but one can get a
pretty good idea. Will post about that tomorrow.

The file size on this combined image is a little on the
large size because it's a gif which handles contrasty
lines and text without distortion.

> The attached image shows a sharp bend in the Snake River (arrow) that is near the Owyhee/Ada/Canyon county boundaries. See http://www.topozone.com/map.asp?z=11&n=4793447&e=545429&size=l for a topo map.
>
> I would have to agree with Doug that the 2nd photo can't be 2800 ft AGL or MSL. The distance from where the Snake River enters the photo on the left and exits at the bottom (or other way round) is about 12 miles. Photo #1 is about the same scale.

I had the flight computer record when it took the picture. It says it took 8 pictures on the ground and 2 in flight. I have 8 pictures taken on the ground and 2 taken in flight. I agree that the image scales look wrong, but find it odd that the flight computer records the first 8 pictures correctly.

I'll try lining up the flight computer's log to the APRS log.

One way to get an approximate height would be to take a known island or cut across the bend in the picture, get that distance off a topo map, then do a little trig. Since the camera doesn't point straight down, the result should be considered only approximate, of course. Or even use navigation's Distance Off formulae to work out the probable height.

We'd have to know some details about the camera's field of view. We know the island is yay big in the photo, but what angular distance is that? I did a quick check on the Canon USA web site and couldn't find anything (TVNSP is using an Elph LT, right?). If I can ever find the manual for mine, I'll look in there.

> We'd have to know some details about the camera's field
> of view.

Definitely.

I was trying to infer as much as possible without knowing
that information, which would of course be required for a
complete solution.

If just one of the pictures were known to be shooting straight
down (neither was), that would establish one altitude
(by GPS track info) and then the other could be found knowing
the ratio of scales of the two photographs.

Without knowing even one altitude, it's possible to determine
two small ranges of altitudes from which each of the pictures
must have been taken. That was the main purpose of scaling
the two pictures. Also to immediately establish whether the
second was higher or lower. It turned out to be higher.

Glad that you can make it. I forwarded the email to
Deb, she is handling all of the details for the party.
She should let you know what to bring. The address is:

1740 Paradise Ln
Meridian Id.

If you want to come early to work on radio
modifications be at the house at about 2:00pm. If not,
the party starts at 5:00pm. Of course you can come
early and visit as well.

I found this on a Usenet group I read....

For the FAI, new records have to 5% greater than the previous best.
http://www.fai.org/sporting_code/sc8.asp

Should that apply to use amateurs?

Paul

5261. Re: [KNSP] Records

From: Doug Eubanks
Topic: 5261 Message: 5261

But to what size numbers is this being applied?
Take the current record altitude for an amateur balloon as posted on Ralph's page, it is 120,522 feet. If you have to break that by 5% in order to claim a new record, you would have to exceed 126,583 feet. Over 6000 feet higher!
So, is this really fair? It puts new records out of realistic reach just because our numbers are so large to begin with!

$.02 worth.

From: K. Mark Caviezel
Topic: 5260 Message: 5262

Yeah , those are the standards for the FAI records, presided over by the French. I submit that any amatuer group flying over 110k feet deserves honorable mention on Ralph's records list. And any group that has a flight even ten feet over the 120k flight deserves first place. Ya, ya, ya I know that the GPS is not accurate to ten feet, but who's to say that one GPS was reading high and one was reading low ? I don't see a practical way of really knowing. By the time we worry about GPS altitude inaccuarcies, we could also quibble about APRS module tracker placement on the flight string. I think a lot of your TVNSP flights have one or two boxes. EOSS and some others have multiple payloads that may be spaced out on 50' of payload string. I really don't want to see it evolve to, "Well, our module was at the bottom of the flight string, so, the altitude of the top of the balloon was XXX,XXX feet plus 50 plus 35." Lets just go with indicated GPS altitude and call it good. Anyone who knows anything about it will know that two flights that had record altitude within 100 feet or so of each other were close enough to be effectively tied.

Hi Paul,
EOSS has managed to get ATV from launch to landing. On a recent flight, Chris KB0YRZ sucessfully taped the ATV from the field all the way down to landing, and we have ground station tape from prelaunch to LOS in descent. On EOSS-60, where the payload landed just 10 miles downrange, we got ground station video up until just a few seconds before landing (judging from the sudden transition from P5 to LOS, as the features on the ground were moving out radially in the image at an alarming rate). The Pioneer Astro camcorder on EOSS-4? did capture the whole flight, including the parachute drag, albeit thru a frost-coated lens.

Hi Mike,

When I wrote the statement about getting video for a
complete flight I was referring to an onboard camcorder not
ATV. I didn't know anyone managed to get ATV video of a
complete flight (minus the landing). I'm interested in
knowing more about it.

Can you tell me what kind of equipment was used? What was
the altitude? Was is B&W or Color? I wonder how much the
equipment weighed?

Subject: RE: [tvnsp] Accelerometers

Paul, Bill,

Larry Beck (another ham friend) called the manufacturer and they were glad to send him two free samples - FED EX! Even if we have to buy them they are only $11 each. They are solid state chips with two outputs; a voltage proportional to the force and a pulse train with the pulse width proportional to the force. Most are two axis units. I know there are 100 G and 10 G units. Even the 10 G units are rated to survive something like a 500 G shock. Don't quote me on that. We need to check the specs.

OK, found my motes (page 70): Analog Devices, $11 each. Two free samples. 100 G, 10 G, or 2 G. Larry says we want the "E" versions.

Check the website and look for MEMs, Accelerometers, Selection Guide. The 10 G unit is part number ADXL210E. The 2 G unit is the ADXL202E.

I'd like to fly some on a balloon and record the forces just after burst, landing, etc.

73,

Tony

Not to mention the timimg of APRS beacons vs ascent/descent
rates and instant of the burst event. These aren't noise-level errors
like placement on the flight string and GPS elevation uncertainties.
If first and second place on Ralph's record list are within 1000 ft
of each other, it just makes for a juicer target for #3!

This would require knowing the camera's angular field of view, which
is pretty simple to evaluate on the ground. Just be sure the
calibrated scale is at least 50 focal lengths away from the lens to
minimize errors due to uncertainty in the position of the focal plane.

Hi Jeff,
EOSS has flown ATV on nearly every flight since EOSS-1 11 years ago.
We use a PC Electronics KPA-5 1W xmtr on 426.25 MHz and a Little Wheel
horizontal omni on the balloon. With 2 Li D-cells and a dc-dc
converter and 2 cameras (up and down), the ATV module weighs 3.3 lb.
The ground station uses an 18-el HyGain yagi with mast mounted ARR
1 dB LNA on an az-el mount and a PC Electronics downconverter. This
gets us P3+ out to about 50 miles downrange. It also is the "anchor"
which fixes our ground station to the launch site.

I think I'll have the first draft completed early next year. I have four editors looking at the chapters for accuracy and will add them comments when the first draft is complete. Then Parallax get's their chance to edit it. I hope by summer of 2003 to see the galleys.

Jeff -

I got the accelerometer samples in today. Check out this link
http://www.parallax.com/detail.asp?product_id=28012
Looks like parallax is already using the same unit. They have it on a
board with support components and standard pin spacing. The unit's
are SMC's. I have 2 JE's and 2 AE's. The AE's have a better
temperature spec. -40 to +85 C. The JE's are 0 to 70 C. I'll make up
a board and put a JE on for you to play with. We can save the AE's for
Near Space missions. They are 2g units.

John, I had one of my students put your PS on the oscope.
There's a very tiny ripple on the output. The ripple is approximately
2 mV peak to peak at a frequency of on the order of 1 kHz.

It looks like a good PS.

5284. Near Space Experiments

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-12-06 14:43:27 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 5284 Message: 5284

I just finished chapter eight of my book (experiments). The chapter ran to 59 pages long, the longest chapter of the book. At the end of each chpater I add a humor section. For chapter eight, the humor section is a list to ten experiments one ought not perform in near space. I have four so far. I'm looking of rmore ideas. If I add your suggested experiment, I'll give you credit in the chapter.

Please email any suggestions you have. Also feel free to pass the request on to toher people. I'm adding the four current experiments here.

Paul

Near Space Humor
Ten Experiments Not To Perform In Near Space

1. Will a cat still land of its feet if dropped from 50,000 feet?

2. How big a crater would a bowling ball make if dropped from 100,000 feet?

3. How many phone calls would the police get if I launch a near space capsule at night if the capsule was covered in flashing strobes, spinning lasers, and playing the tune from the movie, Close Encounters Of The Third Kind?

4. How far will a spud gun shoot in near space. Can this be a test of a near space Star Wars weapon?

Anybody else monitor the NWAPRS list? There have been a few recent messages that lead me to believe there is a group of people in Western Washington that are interested in getting started in near space balloon flights.

I think the UofI flight would be a great time to expose them to ballooning and it would be a good opportunity to recruit some additional trackers for that flight. Unfortunately, I haven't been following the flight information for that one. I'll be glad to pass along the information if somebody will refresh my memory.

I am, of course, assuming nobody has an objection to recruiting more converts to near space ballooning. <G>

5294. RF shielding

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-12-07 22:28:55 UTC
From: Mark Conner
Topic: 5294 Message: 5294

I'm thinking about RF shielding for my next balloon payloads.
The TinyTrak I use as a backup beacon especially has problems
with RF.

I stumbled on to this site through Google:
http://www.lessemf.com/

I was thinking about Mylar film as a possible RF shield, but
there are a couple of other products I saw that might be better:

Velostat film: No data on RF shielding performance, looks like
more of an anti-static product. Cheap (~$5/yd^2)
Flectron fabric: A nylon/copper/nickel woven fabric, rather
expensive (~$50/yd^2).

Anyone out there have their own recommendations for RF shielding
of balloon payloads?

We've used the aluminum tape on our last flight to help shield our Elph LT camera. Hard to say if it did any good.. :-)

Every once in a while you stumble across some copper tape that is similar, but you can solder to it. I have some narrow stuff that I think was originally used in making stained glass. It seems to be heavier than the aluminum, and more difficult to find.

The aluminum tape, I believe, is used to seal up joints in the large metal air ducts.

Mark,

I know that the mylar blocks GPS signals. We had to remove
the mylar on our capsule covers for the GPS to work. Of
course the GPS signal is very weak to begin with.

Good point. There's a surplus electronics catalog that occasionally
sells copper tape. I don't recall the name.

Paul

Stephanie Steele (KC7DBA) gave a presentation about ballooning and showed her Three-Peat capsule at the NWAPRS Summer Gathering in September. She did a great job explaining what the TVNSP does and then hosted a long Q & A session.

As I remember she said Paul had given a similar presentation the year before.

I monitor it Bill.

I sent a reply to the interested party from work,but it did not make it apparently (the sig that is). Maybe i replied to sender only,can't remember now.
I told him about our efforts and how to get in contact with Paul.
Maybe a better salesman like you needs to contact him.
The more the merrier are my feelings ;)

5301. RF shielding effectiveness vs. frequency

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-12-08 18:37:06 UTC
From: Hank <n1ltv@yahoo.com>
Topic: 5294 Message: 5301

> I know that the mylar blocks GPS signals.

The main effect in play here is that the very high
GPS frequency RF is absorbed by many plastics (and
other materials) that are virtually "transparent" at
2 meters and below.

It's all about the frequency, not the strength of
the GPS signals.

Hank

5302. Re: [tvnsp] RF shielding effectiveness vs. frequency

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-12-08 18:44:34 UTC
From: Doug Eubanks
Topic: 5294 Message: 5302

Well, now for my $.02 worth.

When constructing the capsules, why not put a layer of aluminum foil on before you wrap the Mylar or other coverings around it to finish the outside? By being the inner layer, the outer layers would protect it. The foil is cheap and lightweight. This should block RF at the 2m and 70cm frequencies easily enough.

5303. Re: RF shielding effectiveness vs. frequency

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-12-08 19:18:24 UTC
From: Hank <n1ltv@yahoo.com>
Topic: 5294 Message: 5303

In my last message I wasn't thinking of antistatic
or otherwise aluminized mylar, but pure untreated,
uncoated mylar.

In the case of typical aluminized mylar that is
not totally opaque to visible light used for
antistatic packaging, there is some attenuation
at 144 MHz.

According to a quick experiment I just did, it's
way less than aluminum foil.

I took a HT with small duck ant. tuned to wx radio
(162 MHz) and placed it totally inside a mylar
antistatic bag. It played with less signal
strength but still did receieve the signal which was
not too strong to begin with.

A similar sized aluminum foil bag with folded
seams totally shut down the HT before it was even
completely enclosed at the bottom (away from the
antenna). Silencio.

My conclusion is to go with aluminum or other
conductive metal foil for complete shielding
at VHF and up.

Hank

I agree, and you can have mylar or polyethylene under the
aluminum to prevent shorts. I'd be concerned about
aluminum being close to all kinds of electronic components
without a barrier insulating layer.

Hank

Another packaging issue that would need to be considered is the placement of the transmitting (and receiving for that matter) antennas. We mount our 2m dipoles directly to our capsule. Having a conducting coating around the entire capsule would making tuning a dipole nearly impossible within an inch or two.

I think some of the other groups use stand-offs to get their antennas away from the capsule, which should minimize this issue. Depending on your package size and antenna orientation, I would suspect that the package itself would become a parasitic radiator - either a reflector, a director, or somewhere in between.

You could use the package itself as a ground plane and use 1/4 wave 'verticals' coming off the package in various directions, but I would expect that to cancel the effects of the shielding in the first place (since the ground plane is just another radiator).

It seems like there was a good article in Circuit Cellar a few months back covering these issues - I will try to dig that up.

The article I'm thinking of is on page 28 of the May 2002 issue of Circuit Cellar. Since their website will sell you the article for $1.50, I think it's safe to assume that they don't want me to post it here. You can buy the article from http://www.circuitcellar.com/magazine/142toc.htm. Select the article titled 'Working with EMC'.

After a quick re-skim of the page I was thinking of, it basically makes these points:
- Use dual shielding. They show the example of a piece of avionics where there is a metal box inside of another metal box. There appears to be at least an inch of dead-air between the two boxes on most (if not all) sides.
- All cables coming and going into the box need to be properly shielded. As this would apply to us, we would need to be careful of coaxes coming out of the box. All coaxes, temp sensors, experiments, etc, should be properly shielded into and throughout the plug/box. Elsewhere in the article he shows examples of using low-pass filters on all I/O lines.
- Even details as innocent as cooling holes can have a serious impact, especially in the microwave. He makes the statement that .1" ventilation holes can degrade the isolation at 6GHz by 40dB.

I also noticed several other free articles on Circuit Cellar's website at www.circuitcellar.com that may be of interest.

Additional information...

My capsule was also covered with 3 layers of mylar (space blanket) and each layer was seperated with scrim. I say was because the capsule is currently out of service. The capsule is 12 inches wide which means the antennas are 24 inches apart.

None. I have seen some sporadic problems with RFI - mainly on the bench (go figure). The problems have been pretty well alleviated with the addition of SMT ferrite beads on all of the I/O lines. Removing excess cord between the battery packs, sensors, etc seem to help also.

We try to position the controller board as far as possible from the antennas, but our latest package (from GPSL and the other Herrington launch a few months later) is only about 9 inches cubed and the dipoles are mounted directly to the sides.

Our biggest problem was the Elph camera being triggered by RF. To fix that problem, we use a tightly twisted pair of wire to drive an opto-isolator which is mounted to the top of the camera body. We also wrapped the camera in aluminum tape.

That's our story.

my TT2 based vhf tracker cleaned up A LOT when we put
aluminum foil on the audio in cable, just the first 3
inches from the plug and down (just happened to have a
3 inch long piece of aluminum foil hanging around).
I also recommed low power, my trackers are 200mW but
work fine.

Paul, here's you chance to dress the launch crew like nerds, er, uh, professionals. Or is it amateur scientists? There are about a dozen grey lab coats for sale (new?) in Nampa at the Farm Store on 2st St S and 14th Ave. They're $10. Quite inexpensive. There were a few white ones, but not as many. The store buys end of run, odd lots and closeouts. Might get more later.

The polystyrene in styrofoam does not block GPS signals. As I recall, Jeff and I still had a GPS lock through 4 inches of styrofoam.

Subject: [tvnsp] Lab Coats

Paul, here's you chance to dress the launch crew like nerds, er, uh, professionals. Or is it amateur scientists? There are about a dozen grey lab coats for sale (new?) in Nampa at the Farm Store on 2st St S and 14th Ave. They're $10. Quite inexpensive. There were a few white ones, but not as many. The store buys end of run, odd lots and closeouts. Might get more later.

Does anyone know if fiberglass blocks GPS signals?
I bought a van with a glass top and there is room to
put my tracker in the overhead area.

John the Youonger,, I've added a copy of your checklist to my book. I thought I knew your callsign, but......

Can you email me your callsign? I tried looking it up on qrl.net but ran into a bad website. I'll try hunting around some more after class.

Paul

5319. Alkaline Batteries for SAR?

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-12-09 19:42:24 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 5319 Message: 5319

A couple of months ago, someone (I don't remember who)
mentioned that Search and Rescue only used alkaline cells
because they wanted to see the drop in voltage as the cells were
discharged.

I need to verify that statement. Can someone confirm it?

Paul

> I recall, Jeff and I still had a GPS lock through 4 inches of
> styrofoam.
>
> Paul

That's because polystyrene is right up there with Teflon.
Foaming it makes it even a little better. Ordinary
polyethylene is also very good. Epoxy, phenolic, and most
of the other plastics are not so good:

Dissipation factor (this table will line up nicely if
viewed in a monotype font like Courier)
---

100 Mhz 3 GHz

Foamed polystyrene -- .0001
Polystyrene less than .0001 .00033
Teflon .0002 .00015
Polyethylene .0002 .00031

Phenolic .038 .0438
Epoxy (depends .026 .021
on exact type)

Note that plain old polystyrene is superior to teflon at
VHF. The big attribute of teflon in that frequency range
is superb heat resistance.

I couldn't find a figure for fiberglass, and these
values don't tell the attenuation because that
depends on the thickness of the absorbing layer, but
fiberglass will knock down your GPS signal.

Harry, I'd suggest holding a portable GPS under that roof
and actually seeing what it does.

Hank

Instead of shielding the whole capsule, why not just shield the necessary items directly, i.e. the Tiny Trak, etc. that require it.

> Another thing we have experienced is with our coax breaking (jacket and
> braid). We normally fly MJF j-poles and if we don't insulate the coax it

This is more a layout and mechanical issue, I'd think. I'd assume that the coax is breaking due to the cold making it brittle. However, the coax shouldn't even be moving, expecially if you're trying to tie it down. I'd look at moving your tie-downs or providing more so that the coax does not move. Seems to me that should take care of that issue.

Hi Mark,

Mylar per se is a pretty low-loss dielcetric, and a thin film can make a pretty nice radome. However, if it's coated in aluminum, i.e. aluminized mylar, it should serve as a pretty effective RF shield from VHF up. Provided, of course, that there are no unbonded seams, and that's the tough part. Any gap over even a fraction of a wavelength long, regardless of how skinny it is, will act as a "slot antenna" and pass RF quite nicely, thenkyew.

Copper sheet is probably the most effective shielding material that's readily available, and the seams bond easily using solder. But it is heavy, unless you're using it as part of the package structure. If you can get ahold of some 0.032" 1 oz printed circuit board scraps from a local fab house, you might end up with the best of both worlds.

I've used kitchen-grade aluminum foil for shielding over foamcore structures with some success; I avoid the "slot antenna" issue by overlapping seams by at least 1/2" (this forms a "waveguide beyond cutoff") and/or by bonding on strips of Cu flashing which has been severely roughened using a center punch to make sharp-edged holes which bite thru the Al oxide to form a gas-tight bonded joint.

You're not the only one who's encountered EMC susceptibity with the TinyTrack. And shielding may not be the only treatment necessary; filtering and bypassing the leads entering the shield box may also be needed, and may even obviate the need for a full shield. It may also help to move the beacon antenna as far away as practical using well-shielded (i.e., not Rat Shack) coax. RG-141 is excellent and quite robust, albeit exquisitely expensive!

Paul,

Al duct tape will work, but it's more expensive than Al foil (I use Elmers to glue it to foamcore), and the adhesive is non-conductive in the hardware store variety. 3M does sell stuff with conductive adhesive, but if you go that route, may as well use their Cu material.

A couple of students from U of I would like to visit with TVNSP. I'd like to arrange a presentation for them. Is the TVNSP interested in making this a little more formal? I'd like to show them the ropes. It would be like we did with the University of Montana in 2001.

Input?
Ideas?

Paul

------- Forwarded Message Follows -------
Paul,
When is a good time for me to come down to Boise and visit with your team for an informational/teaching time? There is a small chance I could come down next week on T-Th (Dec. 17-19), but most likely after break (after January 14th). Is there a weekend in particular relatively close to the beginningg of the semester that would be good for myself and possibly another student or two to come down? Let me, know and we'll try and coordinate schedules.
Thanks,
Mike Netzer

Sounds good to me Paul. I would prefer to wait till after the Holidays. My agenda is pretty full till January.
I assume they need the whole enchilada in training, such as; tracking,forecasting,hardware,software,theory etc?

My petty thoughts anyway.

regards,

Randy
N7GPS

>>> verhap@...01.k12.id.us 12/11/02 07:19AM >>>
A couple of students from U of I would like to visit with TVNSP. I'd like to arrange a presentation for them. Is the TVNSP interested in making this a little more formal? I'd like to show them the ropes. It would be like we did with the University of Montana in 2001.

Input?
Ideas?

Paul

------- Forwarded Message Follows -------
Paul,
When is a good time for me to come down to Boise and visit with your team for an informational/teaching time? There is a small chance I could come down next week on T-Th (Dec. 17-19), but most likely after break (after January 14th). Is there a weekend in particular relatively close to the beginningg of the semester that would be good for myself and possibly another student or two to come down? Let me, know and we'll try and coordinate schedules.
Thanks,
Mike Netzer

I agree with Randy, lets wait until after the
Holidays. We have a party/meeting coming up Saturday,
lets discuss how we want to work with UofI students.

My thoughts (limited as they are)
JohnK - the party goer.....

Hi TVNSP

Just a reminder that we are having the Christmas/work party this Saturday. If you haven't sent me an e-mail but can attend it isn't too late.

The work party will start at 2pm. The dinner around 5pm. We are really looking forward to having everyone here.

Just a FYI. They are doing major work on the road south of our house. Right now the road is closed coming from that direction. Supposedly it is to be open this weekend. We will keep everyone posted on the progress. You may have to come in from the next north mile section which would be McMillian, and then turn south. John will be monitoring the 24 repeater if anyone needs directions.

Deb and John

Right. But I don't think we need go into deep detail. This just
needs to introduce them to what's involved.

Paul

Harry, I'd like to include your results in my book. I'll give you credit
for the numbers. Is that alright with you?

Paul

5342. APRS Settings

Yahoo group: tvnsp (2000 — 2002)

From: verhap@occ1.sd01.k12.id.us
Topic: 5342 Message: 5342

Mike, is the webpage from old site about all the settings (the gotchas) for APRS on the new site? The one I'm talking about is the settings we discovered with Stphanie and Randy's help back in 2000.

Paul

No problem Paul!
If you need more let me know.

I wish I could provide the thickness of the carpet,
wood and fiberglass. Just no way to get a measurement.
If I can find a wreck to get them from I'll send you
the numbers.

I'll state that these numbers are for an average car.

Paul

I think we need to review some of the minimul APRS+ settings.
I have noticed we are not transmitting our tracker positions in
a timely manner back to net controls and other lurkers out
there. Some mapping activation features need to be reviewed
and shared among members also. Time to compare notes on this
again.

Back to my pot luck dinner at work..yum (in training for the Holidays) ;)

5350. Balloon Track

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-12-13 15:00:20 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 5350 Message: 5350

After our last flight, I have an even greater interest in using Balloon Track during flights. I downloaded the manual the Rick put together and started reading it. I still have a question about making inflight predictions with it. Justin, is this the steps you followed on TV02H?

Start Balloon Track
Click on the Packet Data menu
Select Packet Terminal
Enter the target callsign (in this case KD4STH-11)
Click the Target Capture button

Wait until balloon burst

Click the Extract Data button

I'll download a new copy to play with, but without a flight to try it on and no APRS tracker, I'm a little hard pressed to try it out.

I'm adding another section to the book under the Chase and Recovery chapter to discuss using Balloon Track during the chase. I think TVNSP ought to make it a standard that we use Balloon Track and APRS+ SA on each chase.

Paul

5351. TVNSP APRS Setup

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-12-13 15:04:49 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 5351 Message: 5351

I'm adding the documented TVNSP APRS setup tio the end of this email (as I'm also writing it into the book). Please look it over and see if we need to add or change something. I know we want to limit beaconing of positions to about once per minute. What is the command to do that?

Thanks,
Paul

****
Suggested APRS Setting
These are the APRS setting used by TVNSP Chase Crews.

SETUP
Main Parameters Tab
Callsign: Enter your callsign
Lat: Enter your latitude in decimal degrees
Long: Enter your longitude in decimal degrees

Port 1 TNC
Baud: Enter your TNC baud rate (normally 1200)
Port: 1 Com1

Port 2 GPS
Baud: 4800
Port: 2 Com2: (or 1 Com1: if using a HSP)

TNC Configuration *
Select your TNC□s initialization settings
Note: INITKAM works for KPC2
INITKPC

Via: RELAY,WIDE3-3

Lists Tab
Click Only Track This List

Program Tab
Click SA4 (or your version of Street Atlas)
Click Turn pause off after menu action on position page

Close Setup Window

COMMANDS
Map Features
APRS Tab
Click Include Track Lines

Click Bring SA to the front on new map
Click Include callsigns

Center And Mag Tab
Max Mag: 10
Min Mag: 14

Click OK button

COMMANDS
Clear
Click Remove Lat/Long = 0 90 180

COMMANDS
Click Start Street Atlas

COMMANDS
TNC Commands
Tripmate or Garmin
Click Initialize the GPS

Do not to beacon chase positions too frequently. You primarily want telemetry from the near spacecraft, not from the car behind you. Beaconing positions every minute or two should be fine.

* TNC configuration files are text files containing TNC commands for each particular TNC.

From: Randy Farley
Topic: 5351 Message: 5354

Paul

You want to click on "Flight Analysis" .
You can als open any of the other viewing tools while the flight is
in progress.

From the flight analysis screen you can run "scan map" and
watch the track on a bitmap that you create. If i had the
money here, i would love to have "Mappoint" so this feature
works directly with the moving map program from MS.

I can send you the last flight log to run in "simulation mode"
from packet data/packet terminal/file/open simulation,if you dont't have it.
Make sure you set specify a com port in packet setup.
No tnc required in simulation.
I also have a bitmap for the flight. It is not calibrated precisely.
but it give you the idea of the progress of the flight.

All future net control operators should learn this nice feature in
BT. Don't know why we overlooked it in the past.
Too much to learn i guess ;(
Of course you will have to run two radios and tnc's if you want
to run SA and BT packet at the same time. That is why i let
Justin run the BT packet terminal on his fancy new Dell laptop
and i ran SA+ on my old clunker (Santa are you reading this?) ;)

Justin can give you more details or wait till party and he can demo.

Click Initialize the GPS

Do not to beacon chase positions too frequently. You primarily
want telemetry from the near spacecraft, not from the car behind
you. Beaconing positions every minute or two should be fine.

* TNC configuration files are text files containing TNC
commands for each particular TNC.

From: Justin Formolo <J_Formolo@msn.com>
Topic: 5350 Message: 5355

Paul,

The steps that you mentioned is the process I followed. I downloaded the same manual and read up on it prior to this last launch and decided to try it out. As for the unexplained landing prediction, I'm still puzzled by it. The only thing I can think happened is that the program used a NWS prediction that we did the night before, perhaps corrupting the landing calculation.

You can still use Packet Terminal without a "real" launch. Just take past data and use the simulation mode that Randy mentioned a month earlier. You can pretend that your flying a balloon then after burst, run the post-burst prediction. At least with this, you can see predicted landings with acual landings, without putting any capsules in harms way!

> I'm adding another section to the book under the Chase and
> Recovery chapter to discuss using Balloon Track during the chase.

This is good. Randy and I were playing with the idea of using this program as a helpful resource for TVNSP. It was more of a "gee whiz, I wonder what this does?" Funny that everyone had this program on their computers and never knew what it was. You mentioning it and maybe a future class will definitly be helpful.

> I think TVNSP ought to make it a standard that we use Balloon
> Track and APRS+ SA on each chase.

Only problem is that no one person can run both programs on one computer. Both APRS+ and Packet terminal use their own individual COM ports for info. Unless someone has two radios, two TNCs, two COM ports, and enough horsepower on their laptop,you can only run one at a time. I was talking to Randy about perhaps taking a D7 and use a Y cable to split the data cable into two lines then input each into their own COM port. I don't know if this would work but that's why they invented experimentation. We definitly need one person mobile running pack term AS WELL AS a base station. This way you can see if two predictions correspond.

Justin

In your book you should point out that the "correct" path varies by region. If you use RELAY in the SouthWest you won't get anywhere because they don't support it. There are other variations across the country.

>Do not to beacon chase positions too frequently. You primarily

Since you're targeting this for APRS+SA don't set your position rate to X minutes. Instead use smart beaconing and get the best of both worlds.

Smart beaconing sends positions at a rate that is related to your speed. It also does corner pegging so it sends a position when you've turned a corner. It's designed for getting really good tracking data with minimal packets.

Bill

We should be able to split out the data cable from the TNC since BT should work with receive only data.. You could also piggyback 2 TNCs on one radio. There's probably a way to get both to work on one laptop at the same time, but mine doesn't have enough power for that either.

Good point Bill

Can we do that with a y-cable into another
serial port for BT or do we have to do the HSP sharing thing ?

I have enough problems keeping one port running sometimes ;)

Two tnc's makes for more hardware space requirements
so i prefer your first idea.

regards,

Randy

I was thinking of at least two chase vehicles equiped with tracking
equipment, one with APRS and the second with Balloon Track with
the option of switching to APRS should the first one fail.

I read about that. Unlike APRS though, you can't zoom in and get
all the details.

Rick has done a real bang-up job on Balloon Track. At this rate,
his Balloon Track will replace APRS + for near space work.

Doug, please bring a main dish and a salad.

The address is 1740 Paradise Ln.
Meridian, Id 83642

The way to the house depends on the direction you are coming from. To make matters more complicated, Locust Grove just south of Paradise Ln. has been closed due to construction, should be open tomorrow but who knows?

So here goes:

If you are coming in from the freeway (either east or west bound) take the Eagle Rd. exit (Exit 46?). Turn North on Eagle, you will pass Franklin Rd, Fairview Rd, and Ustick Rd. Turn west on McMillian Rd. I belived this is the sixth stop light from the freeway. On McMillian, go one mile west. There is a 4-way stop sign with Locust Grove. Turn south (left). Paradise Ln will be on on the left hand side of the road, just pass Star Ln (will be a shade over a half mile from McMillian). We are the third house on the left, counting the house on the corner. The house is a split level. There will be a lighted angle in the front yard. If it is dark there will be lots of lights on.

If you come up from Chinden Rd., turn South on Locust Grove. Continue past the 4 way stop with McMillian. The above instructions will work past that point.

I hope this answers the questions on how to get to the house. I will also be monitoring the 24 repeater with my Hand Held, if you are lost or confused call me (KD7HGS) and I will see what I can do.

John and Deb

I read about that. Unlike APRS though, you can't zoom in and get
all the details.

This is true. I just mentioned it in case someone does not have a
mapping program. Topo bitmaps and areial photos are kinda of cool
to play with here too.
Mappoint mapping would take care of this problem
it just costs more money. Rick's website points out we can get it
for $150 with the purchase of APRSpoint (another APRS program)

Wow, i just checked the web and the author has a killer deal now.
http://www.aprspoint.com/

Who wants to be the first on the block to go this route?
My computers are too slow for this.

Rick has done a real bang-up job on Balloon Track. At this rate,
his Balloon Track will replace APRS + for near space work.

That is what i have been thinking. He is a great guy to work with.
I had some issues running Win95 and BT and he helped me fix them.

I'm adding the documented TVNSP APRS setup tio the end of this
email (as I'm also writing it into the book). Please look it over and
see if we need to add or change something. I know we want to
limit beaconing of positions to about once per minute. What is the
command to do that?

See my suggestion in BOLD below:

Thanks,
Paul

****
Suggested APRS Setting
These are the APRS setting used by TVNSP Chase Crews.

SETUP
Main Parameters Tab
Callsign: Enter your callsign
Lat: Enter your latitude in decimal degrees
Long: Enter your longitude in decimal degrees Make sure a negative is entered here.

Port 1 TNC
Baud: Enter your TNC baud rate (normally 1200)
Port: 1 Com1 This will vary,mine is 4.

Port 2 GPS
Baud: 4800
Port: 2 Com2: (or 1 Com1: if using a HSP)

TNC Configuration *
Select your TNC's initialization settings
Note: INITKAM works for KPC2
INITKPC

Via: RELAY,WIDE3-3

Lists Tab
Click Only Track This List

Program Tab
Click SA4 (or your version of Street Atlas)
Click Turn pause off after menu action on position page

Click Position Page Update on NEW positions only.
This prevents screen flickering on the "position" page from all the other stations being digied. At least it helps onslow latptops like mine.

Fill in the "Agent Character" box if you are running MSN's text to speech add-on.
Mine is "Peedy".

Close Setup Window

COMMANDS
Map Features
APRS Tab
Click Include Track Lines
Click Bring SA to the front on new map
Click Include callsigns Do we need this? Adds more clutter to the map. Mine is unchecked and i get the callsign ok without the extra "mapnote"

Center And Mag Tab
Max Mag: 10
Min Mag: 14
Check "Locate function ignore fixed center" if you want to keep track of the chase crew and their relationship to the balloon on the map. Jeff and i discovered this on the last flight.
Not important if you are just interested in the balloon.

Click OK button

COMMANDS
Clear
Click Remove Lat/Long = 0 90 180

COMMANDS
Click Start Street Atlas

COMMANDS
TNC Commands
Tripmate or Garmin
Click Initialize the GPS

Do not to beacon chase positions too frequently. You primarily want telemetry from the near spacecraft, not from the car behind you. Beaconing positions every minute or two should be fine.

* TNC configuration files are text files containing TNC commands for each particular TNC.

Oklahoma Research Balloons
ORB-3 Flight

Launch Site - 36.27917 / -95.82944
Micro-Beacon - 147.450 (+/- 5).

ORB-3 is scheduled for this Saturday Dec, 14th at 9-10am.
Launch site will be from the Owasso High School parking lot.

The winds should carry it NE, E, SE. The lower it stays the more
NE it will track. The higher it goes the more SSE it will track.
Down-range distance estimate is 15-40 miles.

I spent a couple hours with my friend Steve Piltz, at the NWS
office today comparing my wind profiles with their's and they
agree with what I had. I sure wish I had their system here at
the house! :) Too bad ORB doesn't have APRS because they have
overlaid APRS stations on their radar so they can keep track
of storm spotters. How neat! If he has time in the morning he
will try to track ORB using the "Clear Air Mode" on the radar.

Bill, I have a question about your statement in regard to
using "RELAY, WIDE"...

>in the SouthWest you won't get anywhere because they don't
>support it. There are other variations across the country.

I am curious to know where in the SW you are referring to. I
have travelled a great deal in OK, TX, NM, AZ & UT. I use
RELAY,WIDE3-3 or WIDE5-5 and never had a problem. Without the
support of RELAY low-power or distant stations will not get
to a digi.

I did receive a message once from a NM station that asked that
I not use WIDE5-5 while in NM.

Hi all,

Time for me to ask a question.

As far as I know only the Tiny Track can do smart beaconing.
The KPC3+ cannot. We use the KPC3+ in our chase vehicles to
be able to interface with our laptops which is something the
Tiny Track can't do therefore we have to set a beacon rate
of X minutes. Am I right or wrong?

Jeff,
The smart beaconing is in the program, not in the
TNC.
I only run APRS when chasing and use a Kenwood
7950 that
is permanently mated to an AEA PK-88. It has to
have the
laptop to be functional, but that is fine for what
I use it for.

I happened to get this email tonight and thought it may be of interest after all of the EMI discussion.

No guarantees on the company - this was unsolicited...

Yes, it does. It can even do it with the GPS attached directly to the TNC.
Even better if you have it set right the GPS will beacon at your normal
rate if the computer isn't connected or stops pulling the GPS data.

I'll pull up the setup screen tomorrow to confirm what the settings are and
send out a message.

Bill

Hmmm, thought Arizona was one of the states mentioned that didn't support it. I'll have to dig up the message from the national APRSSIG. I know California doesn't.

>RELAY,WIDE3-3 or WIDE5-5 and never had a problem. Without the
>support of RELAY low-power or distant stations will not get
>to a digi.

Very true, but that only works if there is a RELAY. If the digi only answers to WIDE and no RELAY has retransmitted it the packet goes nowhere even if the digi heard it. In our area that isn't a problem because the digis support RELAY. The home based RELAY's are pretty sparse.

I'll dig up that message and send it. The bottom line is that there isn't one path that works everywhere, so Paul should mention that local practice should be followed in his book. (and you would not even believe how heated some of the discussions on path and beacon rate get...)

at 98,400 feet. Anyone who hasn't seen this video needs to now (Quicktime movie):
http://www.ksu.edu/humec/knsp/images/98b.mov .

The video was from a camcorder. Bring a video tape to the
Christmas party can we can make a copy for you.

Jeff, can you bring your TV/VCR? I'll bring mine and we can dup
tapes for anyone missing one.

W7MJR, will you attend our Christmas party? It's on the 14th. At
it we'll mod some Alinco DJ-S11s for near space.

> I noticed one KNSP flight (97C) with ATV which suffered antenna damage at launch.
However, there's a number of great video recordings and SSTV images from many of the KNSP
flights.
Were there any other ATV flights besides 97C?

The first three of 1997 were ATV flights. In 1998 we started
sending SSTV with the Kenwood VC-H1.

> Didn't Francis have a 23 or 13 cm antenna? It seems you would want to use 70 cm for
maximum range
and signal strength (@ 1-2W) and use one or two strategically placed ground
stations with preamps and maybe high gain Yagis or even phased arrays, e.g. two phased
10-11 element beams
with a good GaAs preamp mounted to a heavy-duty tripod? (I have no ATV experience, but I
have a feeling this might be changing.)

I'm hoping to test 2.4 GHz frequencies. They don't require a
license and with a good dish on the ground, we may be good
reception at near space distances.

> Is there an ATV community here in the Treasure Valley? I haven't heard of any local ATV repeaters
(there's one on Mt. Harrison) although I'm new to amateur radio and haven't made many contacts.
Also, would you want the audio transmission along with the video, i.e. is it worth the extra circuitry and weight?

None that I know of. I have ATV for near space, but to use it, we
need a ATV ready ground station (another job for mission control?)

5385. ORB-3 Preliminary Flight Results

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-12-15 04:20:19 UTC
From: Harry M
Topic: 5385 Message: 5385

Oklahoma Research Balloons
ORB-3 Preliminary Flight Results

The balloon with payload was launched at 09:37 CST.
The initial track was to the N then E then SE as
predicted. The actual path was much further east and
south of predicted. The micro-beacon was heard and
tracked by several QTH's in the area, a station in
Bentonville, Arkansas and a station in Coffeyville,
Kansas from a distance of 50-60 miles. The signal was
lost at around 11:50 CST. After some repeater hopping,
asking for help in locating the signal, it was picked
up at around 3pm at the QTH of a local HAM along the
predicted path. We were able to aquire the signal and
pinpoint ORB-3's location with his help in a pasture
in the very wooded and rolling hills of eastern Oklahoma.
The land owner was not at home and the sun had set, so we
will return tomorrow (Sun) to see if we can enter the
property to retrieve the payload.

That is if the cows don't eat it first! :)

5386. Smart Beaconing in APRS+SA -was- RE: [tvnsp] TVNSP APRS Setup

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-12-15 07:22:28 UTC
From: Bill Herrmann
Topic: 5351 Message: 5386

Ok, here's how you turn it on. (For reference I'm using APRS+SA 2.15 but it's been the same for a little while.)

Note: I am assuming that you have APRS+SA already set up and running and just want to turn on Smart Beaconing. I'm also assuming that you have your GPS connected to a KPC3+ TNC via the radio port.

From APRS+SA select Setup and then Main.

In the "Port 1 TNC" section of the setup screen change the mode to "Pico" - This should cause APRS+SA to retrieve GPS data from the TNC by sending a Ctrl-E you should see that data on the GPS tab within APRS+SA. There is a setting in the TNC but I believe the default setting is correct for this use.

In the "Port 2 GPS" section of the setup screen:
Port should show closed
Mode should show NMEA
Check the check box just to the left of the "Smart" button.
Click the "Smart" button to set things up. (The defaults are probably a good starting point.) There are 3 buttons on the bottom of the new dialog box. The 2 plot buttons give you a visual representation of how your smart beaconing will work based on your speed.

Note: The slow rate is a threshold. It is possible to set smart beaconing such that it beacons more slowly at slow speed + 1mph than it does at 0mph.

Here's how it works:
The TNC gets your position from the GPS just like it does now and stores that in the LT buffers. Periodically APRS+SA retrieves that by sending a Ctrl-E to the TNC which causes the TNC to regurgitate the contents of all 4 LT buffers to the RS232 port.

Note: Do NOT leave old data in unused buffers or your position may be wrong.

From there APRS+SA can decide when to send positions based on the smart beacon settings.

Here's the cool thing - When the TNC sees a Ctrl-E it resets the BLT timers just like the TNC had just transmitted a position. As long as the TNC sees a Ctrl-E before a BLT timer expires it will never send a position on its own. If it doesn't see that Ctrl-E it reverts to it's current behavior. This, of course, covers all those silly things like hung laptops, disconnected serial cables and the like. The one catch is that the BLT timer reset won't work if you use the START parameter with your BLT settings. However, all that happens there is that the TNC sends your position like it does now and APRS+SA does too.

Bill

Below is an extract of the message that I was basing that comment on. I haven't contacted the author to ask his permission to cross-post his id, but his posts generally have good enough information that I've set up my email program to flag his posts so I don't miss them.

Sounds like Harry's experience says that AZ may be supporting RELAY at least in some areas. I've seen numerous references to CA especially in the LA area not supporting it and really strongly discouraging people from using it.

5390. RE: Video

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-12-15 19:22:04 UTC
From: Tony Barrett
Topic: 210 Message: 5390

Hey Mike,

There used to be TWO ATV repeaters on / near Shafer Butte, but I don't think either is functional now.

I know of about a dozen hams in the Treasure Valley that run ATV periodically. We used to run a lot of ATV for the Boise River Festival, but not so much anymore. See the December 1997 issue of QST, page 28, for details about ATV in Boise.

Transmitting the audio with the ATV video takes just a few additional very lightweight components and nearly no extra power.

I have a "portable" ATV phased array receiving station with heavy duty tripod and preamp for 433 MHz (+/- 20 MHz). I also have pocket-sized 5 watt and 15 watt ATV transmitters for the UHF band.

The biggest problem with flying ATV on a balloon is DC power. With its wide bandwidth signal ATV is pretty power hungry. The challenge / expense is flying enough batteries to transmit for an hour or two while keeping the weight reasonable. The other concern is the cost ($ and build time) of the ATV gear and being comfortable with the risk of losing it.

Best regards,

Tony - N7MTZ

We can get about 45 minutes worth of video out of a 1500mAh NiMH pack with some to spare. That includes a 1.5W transmitter, a color video camera, and a GPS/callsign overlay. I don't have the equipment at the house to measure, but I'd guess if you multiply your output power times about four, you'd be in the ball park.

So far we've had relatively good experiences - I had video mailed to me from about 200 miles south of the balloon (near burst). It takes a good, omni-directional antenna on the balloon that doesn't fade much while spinning. Also, plan on at least 10 elements on a Yagi with a preamp, pointed directly at the package (not in a vehicle).

Just be forewarned - don't expect camcorder-quality video!

At 12:22 PM 12/15/02 -0700, you wrote:

Hey Mike,

There used to be TWO ATV repeaters on / near Shafer Butte, but I don't think either is functional now.

I know of about a dozen hams in the Treasure Valley that run ATV periodically. We used to run a lot of ATV for the Boise River Festival, but not so much anymore. See the December 1997 issue of QST, page 28, for details about ATV in Boise.

Transmitting the audio with the ATV video takes just a few additional very lightweight components and nearly no extra power.

I have a "portable" ATV phased array receiving station with heavy duty tripod and preamp for 433 MHz (+/- 20 MHz). I also have pocket-sized 5 watt and 15 watt ATV transmitters for the UHF band.

The biggest problem with flying ATV on a balloon is DC power. With its wide bandwidth signal ATV is pretty power hungry. The challenge / expense is flying enough batteries to transmit for an hour or two while

keeping the weight reasonable. The other concern is the cost ($ and build time) of the ATV gear and being comfortable with the risk of losing it.

Best regards,

Tony - N7MTZ

> I was poking around on the KNSP web site looking for ATV flight information
and ran across this spectacular video footage of the Flight 98B balloon burst (with sound)
at 98,400 feet. Anyone who hasn't seen this video needs to now (Quicktime movie):
http://www.ksu.edu/humec/knsp/images/98b.mov .

The video was from a camcorder. Bring a video tape to the Christmas party can we can make a copy for you.

Jeff, can you bring your TV/VCR? I'll bring mine and we can dup tapes for anyone missing one.

W7MJR, will you attend our Christmas party? It's on the 14th. At it we'll mod some Alinco DJ-S11s for near space.

> I noticed one KNSP flight (97C) with ATV which suffered antenna damage at launch.
However, there's a number of great video recordings and SSTV images from many of the KNSP flights.
Were there any other ATV flights besides 97C?

The first three of 1997 were ATV flights. In 1998 we started sending SSTV with the Kenwood VC-H1.

> Didn't Francis have a 23 or 13 cm antenna? It seems you would want to use 70 cm for maximum range
and signal strength (@ 1-2W) and use one or two strategically placed ground
stations with preamps and maybe high gain Yagis or even phased arrays, e.g. two phased 10-11 element beams
with a good GaAs preamp mounted to a heavy-duty tripod? (I have no ATV experience, but I have a feeling this might be changing.)

I'm hoping to test 2.4 GHz frequencies. They don't require a license and with a good dish on the ground, we may be good reception at near space distances.

> Is there an ATV community here in the Treasure Valley? I haven't heard of any local ATV repeaters
(there's one on Mt. Harrison) although I'm new to amateur radio and haven't made many contacts.
Also, would you want the audio transmission along with the video, i.e. is it worth the extra circuitry and weight?

None that I know of. I have ATV for near space, but to use it, we need a ATV ready ground station (another job for mission control?)

Attachments: 1 described; binary payloads are missing from this source WARC

Hi Tony,

I appreciate the information. Yeah, I have come to realize the battery weight is a major factor. The heat sink also becomes significant for higher power transmitters, but once again, so does the power source! As reference, my Dell laptop uses a 4500 mAhr Li-ion @ 14.8 volts, weighs in at about 16 oz, and costs ~100 bucks. Not bad capacity/weight/cost, but yes, I would hate to lose it (along with the boards and camera) in TJ Strike reservoir or the land of Oz!

Perhaps a command signal to the balloon could control the transmitter output power based on feedback from received signal strength/quality? This might be a means of reducing unnecessary power consumption. I wonder if there have been many balloon flights with control "uplinks?"

Finally, are there any ATVers (not to be confused with the other kind like Gary K7TIH) in the SE Boise area? I don't have a directional 70cm antenna (I'll build before I buy) or ATV receiver (I'll buy before I build), but I could tune in nearby CATV frequency stations off the omni for a "taste." Is ATV something that's kind of died off in the area? Is it going the way of packet?

The high altitude balloon application seems to lends itself quite well to ATV since there really isn't any readily accessible internet access up there at 80K+ feet for streaming video:) <TANGENT>This gets me thinking --- has anyone contacted a satellite from a balloon?</TANGENT>

I see that a number of folks have worked with ATV in near space since the early nineties, and they have a wealth of knowledge and successes to share. At the same time, there still seems to be some significant technical challenges and the technology and cost continue to improve.

Thanks,

Mike - W7MJR

P.S. I'd like to check out your portable ATV systems sometime if you don't mind.

>Why is it discouraged? [RELAY]

This is based on information gleaned from a number of messages rather than any personal experience there.

It appears to be because of the channel congestion it causes. LA in particular has a very unique RF environment. They're in a basin with mountains east of them so they have very good coverage from the wide digis. The normal HAAT calculations don't work well when you have mountains on one side and sea on the other. I understand that the FCC has had problems with trying to assign frequencies in the area too.

They also have lots more people running APRS and a lot more infrastructure.

Bill

5395. APRS Settings

Yahoo group: tvnsp (2000 — 2002)

I've added another two pages explaining why TVNSP recommends the APRS settings it does. However, there are a few settings I don't understand (it comes with the territory when you don't actually use the program).

What other text to voice agents exist out there? I've seen Peedy and know one other one exists, but I don't recallt he character.

Why turn pause off after menu action on position page?

Why select to position page update on new position only?
- Can a page be updated when the balloon hasn't sent a new packet?

Why did we use a max and min mag of 14 and 10?
- is there a time you might want to set them to different values?

Why select to remove lat/long = 0 90 180?

Thanks Bill for your smart beaconing notes. I'll incorporate them.

I plan to send an updated copy of the APRS section of Chapter 11 this week, once I have everyone elses notes.

> It looks to get almost as bright as Venus is now by
> mid Jan 2003.

[from Sky and Telescope magazine]

A preliminary orbit calculated by Brian G. Marsden of the Minor Planet Center in Cambridge, Massachusetts, indicates that this comet is headed for perihelion in late January, when it will pass well inside the orbit of Mercury and may brighten considerably. Unfortunately, it will then be almost directly behind the Sun as seen from Earth, hence virtually impossible to observe.

Before that time, Northern Hemisphere observers should be able to follow the comet with binoculars in the morning sky through mid-January. Skywatchers in the Southern Hemisphere are in a position to see it emerging from the Sun's glare in late February, in the evening sky.

Currently the comet is about 7th magnitude, making it a viable binocular object for amateurs. It could be 6th magnitude or brighter by the year's end.

5398. Smart Beaconing in APRS+SA -was- RE: [tvnsp] TVNSP APRS Setup

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-12-16 18:07:06 UTC
From: Randy Farley
Topic: 5351 Message: 5398

Bill

Good explanation how SA retrieves gps data from the tnc
in the "pico" mode. Had no idea what the "pico" mode did.
I thought it was for the Paccom tnc's.

I know i have to do the ctrl-e thing manually in pocetAPRS
once in awhile with the Kenwood Ht. The built in Tasco tnc gets fails to take the gps data and spit it out on initialization sometimes. Probably operator error most of the time.

One question, does the "enable transmit - TNC/TCP" box in setup need to be unchecked? Seems like when it is checked,we keep showing our position from the lat/lon setting in the setup page. Or do we check it and set our "position and staus" rates
to a number higher than the expected flight time so SA+ never
transmits our icon and lat/lon from the program setup page?

regards,

Randy

>>> bherrman@... 12/15/02 12:22AM >>>
Ok, here's how you turn it on. (For reference I'm using APRS+SA 2.15 but
it's been the same for a little while.)

Note: I am assuming that you have APRS+SA already set up and running and
just want to turn on Smart Beaconing. I'm also assuming that you have your
GPS connected to a KPC3+ TNC via the radio port.

From APRS+SA select Setup and then Main.

In the "Port 1 TNC" section of the setup screen change the mode to "Pico" -
This should cause APRS+SA to retrieve GPS data from the TNC by sending a
Ctrl-E you should see that data on the GPS tab within APRS+SA. There is a
setting in the TNC but I believe the default setting is correct for this use.

In the "Port 2 GPS" section of the setup screen:
Port should show closed
Mode should show NMEA
Check the check box just to the left of the "Smart" button.
Click the "Smart" button to set things up. (The defaults are probably a
good starting point.) There are 3 buttons on the bottom of the new dialog
box. The 2 plot buttons give you a visual representation of how your smart
beaconing will work based on your speed.

Note: The slow rate is a threshold. It is possible to set smart beaconing
such that it beacons more slowly at slow speed + 1mph than it does at 0mph.

Here's how it works:
The TNC gets your position from the GPS just like it does now and stores that in the LT buffers. Periodically APRS+SA retrieves that by sending a Ctrl-E to the TNC which causes the TNC to regurgitate the contents of all 4 LT buffers to the RS232 port.

Note: Do NOT leave old data in unused buffers or your position may be wrong.

From there APRS+SA can decide when to send positions based on the smart beacon settings.

Here's the cool thing - When the TNC sees a Ctrl-E it resets the BLT timers just like the TNC had just transmitted a position. As long as the TNC sees a Ctrl-E before a BLT timer expires it will never send a position on its own. If it doesn't see that Ctrl-E it reverts to it's current behavior. This, of course, covers all those silly things like hung laptops, disconnected serial cables and the like. The one catch is that the BLT timer reset won't work if you use the START parameter with your BLT settings. However, all that happens there is that the TNC sends your position like it does now and APRS+SA does too.

Randy

>>> verhap@... 12/16/02 08:12AM >>>
I've added another two pages explaining why TVNSP recommends
the APRS settings it does. However, there are a few settings I
don't understand (it comes with the territory when you don't
actually use the program).

What other text to voice agents exist out there? I've seen Peedy
and know one other one exists, but I don't recallt he character.

Microsoft Agent is the actual name of the text to speech program:
http://www.microsoft.com/msagent/
Peedy,Genie,Merlin and Robby are the character names in the
program.

Why turn pause off after menu action on position page?

This box is not used in the newer versions of aprs+.
He now has "Turn Scrolling On After Menu Action on Position Page" I don't use this because i prefer to scroll the screen myself rather than the page scroll down as it fills with stations.
It is a personal preference i would not recommend to use.

Why select to position page update on new position only?
- Can a page be updated when the balloon hasn't sent a new
packet?

If you don't check this box,the position page flickers because it is trying to refresh every time it hears a position report in a busy network. It may not be a problem on fast computers.

Yes it can be updated any time you want,either manually or by a timer setting in the "Maps" tab.

Why did we use a max and min mag of 14 and 10?
- is there a time you might want to set them to different values?

I don't use the min/max setting myself. It is just a personal preference setting at which magnification you want the map to refresh too each time it is updated. I prefer to check the "locate" function ignore Fixed Center" box in the "Maps" tab. This keeps all "tracked" stations on your map at all times. This way i can see the balloon and all the chase members and there relationship to the balloon. I can zoom to any magnification
with one keystroke any time i want.

Why select to remove lat/long = 0 90 180?

Sometimes there are stations out there that loose lock on their
gps's or forget to turn them on. When one of these sends a positon report, you end up off the W. coast of Africa (00/00)
sometimes when your map updates .

Thanks Bill for your smart beaconing notes. I'll incorporate them.

I plan to send an updated copy of the APRS section of Chapter 11
this week, once I have everyone elses notes.

From: verhap@occ1.sd01.k12.id.us
Topic: 5342 Message: 5401

Here's what I currently have for suggested APRS settings. When
you get a chance, please look them over. I still have a few holes to
fill. Randy gave me some of the answers, but when I printed his
message, text ran off the page. I'll find the message in the
archives and start filling holes this afternoon.

If you any gaps, please let me know. If you have recommended
settings that differ, please let me know also along with an
explanation (there's more than one way to skin a rabbit and I want
to let readers know the reasons behind the selections).

Paul

++++++++++++++++++++++++++++

1.1.3 TVNSP Suggested APRS Setting
These are the APRS setting most frequently used by the
TVNSP Chase Team. Note, APRS is an evolving program.
Settings and their names change from time to time, but this guide
will get you through most of the hurdles.

SETUP
Main Parameters Tab
Callsign: Enter your callsign
Lat: Enter your latitude in decimal degrees
Long: Enter your longitude in decimal degrees
Note: If west of the Prime Meriden, precede the longitude with a
negative sign

Port 1 TNC
Baud: Enter your TNC baud rate (normally 1200)
Port: 1 Com1
Note: This is assuming your TNC is connected to COM Port 1.
Mode: Pico

Port 2 GPS
Baud: 4800
Port: 2 Com2: (or 1 Com1: if using a HSP)
Mode: NMEA
Click the Smart button

TNC Configuration
Select your TNC□s initialization settings
Note: INITKAM works for KPC2
INITKPC

Via: RELAY,WIDE3-3

Lists Tab
Click the Only Track This List option

Program Tab
Click the SA4 (or your version of Street Atlas) option
Click the Turn Pause Off After Menu Action On Position
Page option
OR
Click the Turn Scrolling On After Menu Action On Position
Page option
Click the Position Page Update On New Positions Only
option

Fill information for ☐Agent Character☐ if using a text-to-speech
add-on like Peedy

Close Setup Window

COMMANDS
Map Features
APRS Tab
Click the Include Track Lines option
Click the Bring SA To The Front On New Map option
Click the Include Callsigns option

Center And Mag Tab
Max Mag: 10
Min Mag: 14
Click the Locate Function Ignore Fixed Center option

Click the OK button

COMMANDS
Clear
Click the Remove Lat/Long = 0 90 180 option

COMMANDS
Click the Start Street Atlas option

COMMANDS
TNC Commands
Tripmate or Garmin
Click the Initialize the GPS option

If you do not wish to repeat this process the new time you go on
chase, then do the right thing and register your copy of APRS.

1.1.4 Notes On TVNSP Suggested APRS Settings

SETUP/Main Parameters Tab
Amateur radio and APRS requires a callsign, which every
APRS packet sent is prefixed. The latitude and longitude is the
initial location of the APRS station and is the position reported if
the GPS is left off when APRS is started. A negative longitude

is the standard for a west longitude as a positive longitude is the standard for east longitude. Many APRS stations in the US are displayed in the Atlantic Ocean because longitudes are not preceded with a negative symbol.

SETUP/Port 1 TNC and Port 2 GPS
The most effective APRS stations appear to use two separate comm ports for the GPS and TNC as opposed to a hardware serial port (HSP). The HSP electronically switches one comm port between two serial devices. Currently, most packet traffic occurs at 1200 baud (although the technology for 9600 packet does exist) and NMEA compliant GPS receivers operate at 4800 baud. Setting the TNC mode to Pico, the GPS to NMEA and clicking the smart button activates smart beaconing. In smart beaconing, positions from the GPS are sent less frequently as long as there is no change in the speed and direction of the chase vehicle. When the speed or direction changes, an immediate position report is transmitted notifying Mission Control the Chase Team has changed directions. Smart beaconing reduces the amount of packet data required to specify the position of the Chase Team.

SETUP/TNC Configuration
TNC configuration files are text files containing TNC commands for each particular TNC. When started, APRS puts the TNC into the proper settings by sending the commands in the TNC□s initialization file to the TNC.

SETUP/Via
Note: Consult with your local APRS community. Some locations do not support RELAYing. A WIDE3-3 setting lets packets from the near spacecraft be relayed three times through digi-peaters.

SETUP/Lists Tab
You select the objects you want to track in the ?????? column, rather than having APRS tracking every APRS packet it receives.

SETUP/Program Tab
There are several mapping programs to select from, not just Street Atlas.

??How are they selected??

Click the Turn Pause Off After Menu Action On Position Page
??????????
Selecting to Position Page Update On New Positions Only prevents APRS from updating the map with every position report.

Several text to speech programs are available for APRS. Peedy is one popular one. Peedy is a parrot program that moves its beak when speaking the text it is receiving. Peedy also moves his head around between text packets. Text-to-speech agents are popular with civies that have never watched the tracking of a near spacecraft.

Other Microsoft Agents include, Genie, Merlin, and Robie. They can be found at http://www.microscoft.com/?????????

COMMANDS/Map Features/APRS Tab
Track lines show the past location of the near spacecraft. Without track lines only the current location is seen without the context of a history. Bringing SA to the front keeps the Street Atlas map in the front window. If the map is not brought to then front, then the Chase Team must click to bring the map to where you can see it. Displaying the callsigns of tracked objects is optional, but useful when trying to identify chase vehicles.

COMMANDS/Map Features/Center And Mag Tab
Street Atlas has a range of magnifications. Select ranges suitable to you, or even do not select a maximum and minimum magnification. The Locate Function Ignore Fixed Center option prevents APRS from centering the Street Atlas map on just the near spacecraft. This is useful when you want to track the Chase Team and their relationship to the near spacecraft. Without selecting this option, the map re-centers itself on the near spacecraft every time a packet from the near spacecraft is received.

COMMANDS/Clear
Removing Latitudes and Longitudes containing 0, 90, and 180 degrees prevents a bad GPS coordinate from sending the map to the North Pole or other nonsense location. Bad coordinates can occur when a GPS loses its lock or when an APRS☐ GPS has not been started.

COMMANDS
By selecting to start Street Atlas, APRS opens Street Atlas when you start APRS. There is no need to start both programs.

COMMANDS/TNC Commands/Tripmate or Garmin
Most GPS receivers, like Garmin and Tripmate, accept commands. APRS commands instruct the GPS which sentences to send.

5402. GPS Signal Quality

Port 1 TNC
I think the mode setting should note "MODE7" for
the Kenwood aprs ready radios. And "ALINCO" for their
aprs ready radio.

Still checking your list twice to see if you have been naughty
or nice. ;)

Randy
N7GPS

>>> verhap@... 12/17/02 07:28AM >>>
Here's what I currently have for suggested APRS settings. When
you get a chance, please look them over. I still have a few holes to
fill. Randy gave me some of the answers, but when I printed his
message, text ran off the page. I'll find the message in the
archives and start filling holes this afternoon.

If you any gaps, please let me know. If you have recommended
settings that differ, please let me know also along with an
explanation (there's more than one way to skin a rabbit and I want
to let readers know the reasons behind the selections).

Paul

++++++++++++++++++++++++++++

1.1.3 TVNSP Suggested APRS Setting
These are the APRS setting most frequently used by the
TVNSP Chase Team. Note, APRS is an evolving program.
Settings and their names change from time to time, but this guide
will get you through most of the hurdles.

SETUP
Main Parameters Tab
Callsign: Enter your callsign
Lat: Enter your latitude in decimal degrees
Long: Enter your longitude in decimal degrees
Note: If west of the Prime Meriden, precede the longitude with a
negative sign

Port 1 TNC
Baud: Enter your TNC baud rate (normally 1200)
Port: 1 Com1
Note: This is assuming your TNC is connected to COM Port 1.

Mode: Pico

Port 2 GPS
Baud: 4800
Port: 2 Com2: (or 1 Com1: if using a HSP)
Mode: NMEA
Click the Smart button

TNC Configuration
Select your TNC's initialization settings
Note: INITKAM works for KPC2
INITKPC

Via: RELAY,WIDE3-3

Lists Tab
Click the Only Track This List option

Program Tab
Click the SA4 (or your version of Street Atlas) option
Click the Turn Pause Off After Menu Action On Position
Page option
OR
Click the Turn Scrolling On After Menu Action On Position
Page option
Click the Position Page Update On New Positions Only
option

Fill information for "Agent Character" if using a text-to-speech
add-on like Peedy

Close Setup Window

COMMANDS
Map Features
APRS Tab
Click the Include Track Lines option
Click the Bring SA To The Front On New Map option
Click the Include Callsigns option

Center And Mag Tab
Max Mag: 10
Min Mag: 14
Click the Locate Function Ignore Fixed Center option

Click the OK button

COMMANDS
Clear
Click the Remove Lat/Long = 0 90 180 option

COMMANDS
Click the Start Street Atlas option

COMMANDS
TNC Commands
Tripmate or Garmin
Click the Initialize the GPS option

If you do not wish to repeat this process the new time you go on chase, then do the right thing and register your copy of APRS.

1.1.4 Notes On TVNSP Suggested APRS Settings

SETUP/Main Parameters Tab
Amateur radio and APRS requires a callsign, which every APRS packet sent is prefixed. The latitude and longitude is the initial location of the APRS station and is the position reported if the GPS is left off when APRS is started. A negative longitude is the standard for a west longitude as a positive longitude is the standard for east longitude. Many APRS stations in the US are displayed in the Atlantic Ocean because longitudes are not preceded with a negative symbol.

SETUP/Port 1 TNC and Port 2 GPS
The most effective APRS stations appear to use two separate comm ports for the GPS and TNC as opposed to a hardware serial port (HSP). The HSP electronically switches one comm port between two serial devices. Currently, most packet traffic occurs at 1200 baud (although the technology for 9600 packet does exist) and NMEA compliant GPS receivers operate at 4800 baud. Setting the TNC mode to Pico, the GPS to NMEA and clicking the smart button activates smart beaconing. In smart beaconing, positions from the GPS are sent less frequently as long as there is no change in the speed and direction of the chase vehicle. When the speed or direction changes, an immediate position report is transmitted notifying Mission Control the Chase Team has changed directions. Smart beaconing reduces the amount of packet data required to specify the position of the Chase Team.

SETUP/TNC Configuration
TNC configuration files are text files containing TNC commands for each particular TNC. When started, APRS puts the TNC into the proper settings by sending the commands in the TNC's initialization file to the TNC.

SETUP/Via
Note: Consult with your local APRS community. Some locations do not support RELAYing. A WIDE3-3 setting lets packets from the near spacecraft be relayed three times through digi-peaters.

SETUP/Lists Tab
You select the objects you want to track in the ?????? column, rather than having APRS tracking every APRS packet it receives.

SETUP/Program Tab
There are several mapping programs to select from, not just Street Atlas.

??How are they selected??

Click the Turn Pause Off After Menu Action On Position Page ??????????
Selecting to Position Page Update On New Positions Only prevents APRS from updating the map with every position report.

Several text to speech programs are available for APRS. Peedy is one popular one. Peedy is a parrot program that moves its beak when speaking the text it is receiving. Peedy also moves his head around between text packets. Text-to-speech agents are popular with civies that have never watched the tracking of a near spacecraft.

Other Microsoft Agents include, Genie, Merlin, and Robie. They can be found at http://www.microscoft.com/?????????

COMMANDS/Map Features/APRS Tab
Track lines show the past location of the near spacecraft. Without track lines only the current location is seen without the context of a history. Bringing SA to the front keeps the Street Atlas map in the front window. If the map is not brought to then front, then the Chase Team must click to bring the map to where you can see it. Displaying the callsigns of tracked objects is optional, but useful when trying to identify chase vehicles.

COMMANDS/Map Features/Center And Mag Tab
Street Atlas has a range of magnifications. Select ranges suitable to you, or even do not select a maximum and minimum magnification. The Locate Function Ignore Fixed Center option prevents APRS from centering the Street Atlas map on just the near spacecraft. This is useful when you want to track the Chase Team and their relationship to the near spacecraft. Without selecting this option, the map re-centers itself on the near spacecraft every time a packet from the near spacecraft is received.

COMMANDS/Clear
Removing Latitudes and Longitudes containing 0, 90, and 180 degrees prevents a bad GPS coordinate from sending the map to the North Pole or other nonsense location. Bad coordinates can occur when a GPS loses its lock or when an APRS' GPS has not been started.

COMMANDS
By selecting to start Street Atlas, APRS opens Street Atlas when you start APRS. There is no need to start both programs.

COMMANDS/TNC Commands/Tripmate or Garmin
Most GPS receivers, like Garmin and Tripmate, accept
commands. APRS commands instruct the GPS which sentences
to send.

Bill, in your notes on smart beaconing, you said not to leave old data in your unused buffers. I've seen my capsule start up and send the old data when new data had yet to be sent to it.

How would a tracking vehicle clear their buffers? I clear mine by having the Stamp send new data (not an option on the chase vehicle).

Paul

Hi Paul,

> Harry, can you send me a copy of the GSV sentences you get with
> the GPS in the dash of your car?

Do you want the GSV's from my van test using the Tripmate or
from my standard tracker in the Jeep using the Garmin TracPak?
If you want the van test do you want GSV's from all 3 tests?

> Are you interested in chasing lost balloons in Idaho?

Sure! I'm always up for a good chase.

> What beacon are you using?

The beacon I am using is the Keith Koop (K0OP) beacon. I met
him at GPSL 2002. It uses an MM74HC14N Hex Inverting Schmitt
Trigger (DigiKey #MM74HC14N-ND) to turn on a half-size dip
high-frequency crystal oscillator SG-531PTJ series 29.491mhz
(DigiKey #SE1821ND). I used a standard 555 timer in ORB-3 in
place of the Schmitt. The beacon quit last night after +60
hours using a RS 9v lithium. There is no modulation, just a
carrier in FM, but it can be heard very well on SSB and CW and
on all multiples. I have it on 5 sec, off 5 sec. I don't know
the actual power out but is believed to be in the 10ths of a mw.
The biggest problem around metro areas is interference from
consumer electronics.

I'm sure it can be improved on. Doing that is beyond the scope
of my RF knowledge, but as it is it works great!

If you don't get the attach I will send it direct to you.

From: Randy Farley
Topic: 5406 Message: 5412

From what i have read,they are the most stable (don't loose parameter settings) when it comes to power supply deviation. The Paccom tnc's tend to loose their brains with any fluctuation in voltage supply. Not a good thing at 100K feet.

I started with an AEA PK-12 and it acted the same way. It is also very limited in its control over beacon rate and the type of NMEA sentences it can use from a gps. No telemetry control whatsoever.

The KPC3+ became very popular
mainly due to the fact it had an extra port for the gps/radio which freed up the serial port for the laptop.

My little knowledge base.

Randy

>>> verhap@... 12/17/02 08:05AM >>>
I've always used a KPC3+ TNC for main telemetry on my balloons.
The only reason is that the KPC3+ was the only one I had heard
about when I first started this business.

Is there a good reason Kantronics' TNC is so popular? Should we
be looking at other TNCs? Are KPC3's just that good that no other
TNC is used as often?

Paul

From: Randy Farley
Topic: 5405 Message: 5413

From what i have read.
Most people do not have a good deviation meter to check
their signal . 9600 baud is not forgiving with a sloppy
signal. Some say ham radios do not do a good job with 9600.
With 1200 baud,you can get pretty close
with just your ear or calibrating with another stations tnc.

The Seattle area is really into 9600 baud from what i have
read in the nwsig group.

>>> verhap@... 12/17/02 08:02AM >>>
Back when I was still serving time in Kansas, I heard about 9600
baud packet. I thought it was the new thing and we'd all be running
9600 baud packet very soon. I have yet to hear about anyone
sending 9600 baud.

Is it limited to trunks and such?
Is there a 9600 baud community out there?
Is it not popular for reasons I haven't mentioned?

Paul "9600 clueless" Verhage

Attached is a pic of another of my K0OP beacons encapsulated in epoxy.

I am working on another 2m beacon using a Motorola MC2831 FM xmtr
on a chip. It has a tone oscillator on chip and puts out a lot
more power than the K0OP beacon. The 2831 was used in 49mhz
portable phones. There is also an MC2833 FM xmtr chip that does
not have a tone osc. on chip. The Motorola data book gives
component values for the 2833 on 2m, but not the 2831 which is
on 49mhz. I need for someone to refigure the RF out circuit on
the 2831 for 2m. I am using a 12.288 mhz which puts the output
on 147.456 mhz I have attached the 2831 circuit if someone can do
that for me. I would appreciate it!

Harry

From: n9xtn@cox.net
Topic: 5415 Message: 5415

I chose a KPC-3 (1) because I had one to spare, (2) KNSP used it and I copied major elements of that design, and (3) the KPC-3's are just about bulletproof, RFI-proof, etc. I've had no failures during testing or flight that could be traced to a KPC-3 hardware problem.

I use a v6.0 for the payload and an KPC-3+ v8.3 in the car for tracking. Since I run all telemetry output through the converse mode, I don't need a 2nd serial port on the balloon (though doing so does offer redundancy). Using the 2nd serial port on the TNC for my chase setup allows me to use 2 serial ports on the laptop to let Street Atlas USA show me the "green arrow" for 1 serial input (live GPS data) and APRSPlus gets its GPS data using "Pico" mode.

I've been hearing about a new soundcard TNC program from the APRSSIG (MixW32?). Supposedly it outperforms hardware TNCs. This might have potential for a chase setup.

Interesting. I hadn't thought to comparing the GPS recievers. Can
you send me both? Right now I'm adding about how placement of
the GPS effects signal quality. I could now compare two different
GPS recievers

> > Are you interested in chasing lost balloons in Idaho?
>
> Sure! I'm always up for a good chase.

TVNSP is getting ready to announce the Northwest Super Launch
for the Memorial Day. This will be an opportunity for people to
launch and chase at two events as EOSS would like to host GPSL
in Colorado in 2003. We'll mnake an announcement soon, so this
is just a heads up.

> > What beacon are you using?
>
> The beacon I am using is the Keith Koop (K0OP) beacon.

> If you don't get the attach I will send it direct to you.

I'd would definitely like to get the schematic for the circuit. I'll
make a PCB of it and send several copies to you. I'd like to
experiment with having a PIC take the place of the 555 and use it
to send simple sensor data like temperature. In a future flight, one
of my capsules would start a tape recorder, release the dropsonde,
record the transmissions from the dropsonde on tape, then play it
back over the radio or we'd decode the tape after recovery.

I didn't get an attachment with this email. Was the attachment the
scheamtic?

> on 49mhz.

There's a good reason for the absence of that information.
The 2831 lacks *two* rf multiplier stages that the 2833 has.

Without that "times 4" multiplication factor available, the
2831 doesn't do 144 Mhz very well at all.

You could try it just to see what you get. To get even
a rough idea of power out on 144 MHz you'll probably need
a spectrum analyzer or a narrow pass filter feeding a
wideband sensitive rf power meter becaue there will be
rf at lower than 144.

To tune the 2831 to 144 MHz you just need to resonate that
tapped antenna inductor to 144 MHz. The tapping is done to
get an impedance transformation besides being a tuned
circuit that favors 144 MHz.

I'd recommend setting the crystal frequency as high as the
2831 will go, certainly higher than 12 MHz which would mean
a 12 times multiplication which is totally too much.

If the crystal played at 24 Mhz (144/6) or at least 18 MHz
(144/8) you'd be much better off. 28.8 would be even better
still (144/5).

> I need for someone to refigure the RF out circuit on
> the 2831 for 2m. I am using a 12.288 mhz which puts the output
> on 147.456 mhz.

In a little while I'll come back with the retuned
component values and the explanation of their significance.
The .47 microhenry coil can be reduced to .1 microhenry with
the parallel cap values the same.

Hank

> Paul, they are standard JPG created in PaintShop Pro 7.

I could view the images directly in IE4 from ygroups
website, but I couldn't view them as downloaded files
when viewed by LView or an old Paintshop.

This is the first time Paintshop has not been able to
handle an image that IE4 could. This problem has happened
only very rarely with LView

I'll try a screen capture and then creating the image
in one of these external viewers; that should work
for everything.

Harry,

The 4.7 uH coil doesn't matter; in fact it can be omitted.
It's there just to tune the crystal a little (bending).

I'm sending you separately a 2831 schematic with added tuned
circuit part identifiers so we can be clear about what we're
talking about.

Harry, I got your schematic from Hank. It looks like the same design I got from the wichita group when I still lived in Kansas. I've only had one experience with the beacon. Mark, I and several others where part of the KNSP Chase Team for a dual launch (98B as I recall). We also had to track the capsule on it's milliwatt beacon and ended up finding home electronics instead.

I'll design a PCB for the beacon for anyone interested. Send me email and let me know.

Harry, can you tell me how you used the 555 in the circuit? was it as a replacement for the inverters? In that case, does pin 3 of the 555 connect to pin 14 of the crystal?

I think a PIC can modulate the 555, sending simple telemetry.

Paul

Paul there are 3 things that come to my mind in answer to this question - maybe more as I think about it.

1) Light weight/small size - I saw on one groups web site - without the case it weights about 4 oz.
2) Low power - one 9v battery - I use Lithium in my capsule - my other TNCs require 12v or more
3) APRS aware - direct GPS connect with selected string output - this might be considered 2 reasons

Basically a KPC3+, GPS, and radio is a complete balloon capsule system. All being low power, very light weight is required (wasted?) in batteries. Guessing, 4 oz + 4 oz + 4 oz (generous estimates?) about a 1 lb payload.

I guess readily available is another. I have seen some of the other small TNCs (Pico?) advertised but they are not carried in our local HAM store.

As I recall several years ago, Kantronics was very responsive to the Ham (i.e. APRS) community, I think that went a long way in them becoming popular. I think APRS is probably the most overall active digital mode in ham radio.

Anyway, there is my nickels worth.

> Bill, in your notes on smart beaconing, you said not to leave old data
> in your unused buffers. I've seen my capsule start up and
> send the old data when new data had yet to be sent to it.

I was thinking more of the case where you've previously used the LT buffers but have scaled back their use. You're thinking of before the GPS starts sending valid data.

> How would a tracking vehicle clear their buffers? I clear mine by
> having the Stamp send new data (not an option on the chase
> vehicle).

You can manually clear the buffers with the LT command or there is a parameter "CLEAR" that clears them after the data is sent.

I got bit by turning off GPSHEAD for 1 I wasn't using but not clearing the data out of the LT buffer. The TNC worked fine stand-alone, but when I used smart beaconing it got the content of all 4 buffers and sometimes randomly chose the one with non-current data in it. (That's what I get for trying to economize.)

Hi Paul,

9600 baud packet does work, but it's a bit of a struggle which is why it's not in wider use.

Normal voice FM receiver and xmtr audio amps cut off above 3 KHz and thus won't pass a 9600 baud signal. So the xmit audio must take it's own path directly to the xmtr modulator varactor, and recv audio must be pulled directly off the discriminator. Some newer xcvrs do provide those hooks, though.

Although Part 97.305 does allow up to 19.6 kbaud on 2m, most of the 9600 baud stuff appears on 70 cm since its such a bandwidth hog (20 KHz).

And because the receiver bandwidth is over 20 KHz wide, it hears more noise than a normal FM xcvr, so SNR is degraded unless xmtr ERP is boosted proportionately.

5431. More APRS Questions

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-12-18 15:10:48 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 5431 Message: 5431

I read that if we use a Kenwood data radio, the Port 1 TNC setting should be MODE7. As far as I know, no one here is using the data radios connected to a laptop running APRS. Does everyone have their Port 1 TNC setting set to Pico? Does that work for all non-data radios?

Some of the TVNSP Chase Team sets a min and max mag.
Randy says he doesn't set those, but instead uses Locate function Ignore Fixed Center. Randy's setting lets him zoom out to see the balloon and chase crews. Street Atlas doesn't zoom back in when a packet froom the balloon is recieved. Should that be the standard? Is there a reason for setting a max and min mag?

As I recall, you select a version of Street Atlas by clicking one of the listed options. Are there other mapping programs that people with with APRS (obviously that wouldn't be APRS+ SA). Do you select versions of some other mapping program the same way? Is anyone in TVNSP using something other than SA?

What are the names of the columns inb APRS that shows you the hear stations and the stations you are tracking? I recall once when I ran Jeff's tracker, I clicked on a station in one column to move it over to the column filled with callsigns that were displayed in SA.

The KPC3+ has two ports, allowing you to connect a GPS reciever to it. For those using an older TNC with only one port, I assume they have to connect the GPS to a second port on the laptop. Is that true?

Does anyone like the HSP?

That's it so far. Thanks.

Paul

I read that if we use a Kenwood data radio, the Port 1 TNC setting should be MODE7. As far as I know, no one here is using the data radios connected to a laptop running APRS. Does everyone have their Port 1 TNC setting set to Pico? Does that work for all non-data radios?

You'd have to have a TNC capable of responding to ctrl-E's (PicoPacket, KPC-3+, etc.). Otherwise use "normal".

Some of the TVNSP Chase Team sets a min and max mag.
Randy says he doesn't set those, but instead uses Locate function Ignore Fixed Center. Randy's setting lets him zoom out to see the balloon and chase crews. Street Atlas doesn't zoom back in when a packet froom the balloon is recieved. Should that be the standard? Is there a reason for setting a max and min mag?

Under Map Options, I use "Center Tracks Me" and let the zoom go out so the balloon is on the screen. As I get closer to the balloon, the zoom goes in so that more details are brought up on the screen. I generally put only myself and the balloon on the tracking list so that if I stop getting updates from some other tracked vehicle, the zoom doesn't stay out trying to keep him on the screen.

As I recall, you select a version of Street Atlas by clicking one of the listed options. Are there other mapping programs that people with with APRS (obviously that wouldn't be APRS+ SA). Do you select versions of some other mapping program the same way? Is anyone in TVNSP using something other than SA?

To my knowledge, APRS+SA is the only program that needs this. That's because the file extensions changed with each version (.SA7, .SA8, .SA9,...).

What are the names of the columns inb APRS that shows you the hear stations and the stations you are tracking? I recall once when I ran Jeff's tracker, I clicked on a station in one column to move it over to the column filled with callsigns that were displayed in SA.

"Track" tab.

The KPC3+ has two ports, allowing you to connect a GPS reciever to it. For those using an older TNC with only one port, I assume they have to connect the GPS to a second port on the laptop. Is that true?

Yes.

Does anyone like the HSP?

No, nobody on the planet does. :) As you might recall, I used one for my first two chases in 1998 with KNSP. Rapidly found it was worth the $80-100 for a PC Card serial port. Since then, more laptops have USB ports and USB-serial converters are ~$40. If you have any choice at all, use a 2nd serial port in some form rather than HSP. I found that the switching would corrupt many incoming packets - if you switch often to keep your own position updated, you lose more balloon data, and if you don't switch often you don't stay updated on your own location relative to the balloon.

I read that if we use a Kenwood data radio, the Port 1 TNC setting
should be MODE7. As far as I know, no one here is using the data
radios connected to a laptop running APRS. Does everyone have
their Port 1 TNC setting set to Pico? Does that work for all non-
data radios?

Some of the TVNSP Chase Team sets a min and max mag.
Randy says he doesn't set those, but instead uses Locate function
Ignore Fixed Center. Randy's setting lets him zoom out to see the
balloon and chase crews. Street Atlas doesn't zoom back in when
a packet froom the balloon is recieved. Should that be the
standard? Is there a reason for setting a max and min mag?

Probably the main reason i don't use the min and max settings is
just personal preferences. Seems like i played with the settings and
my laptop or map program would lock up. I would just offer the choices
and let people choose which one they like.
Setting a max or min mag keeps you zoomed in on the balloon if
that is what you want.

As I recall, you select a version of Street Atlas by clicking one of
the listed options. Are there other mapping programs that people
with with APRS (obviously that wouldn't be APRS+ SA). Do you
select versions of some other mapping program the same way? Is
anyone in TVNSP using something other than SA?

Yes there are many more aprs programs that use other
mapping software.
APRSdos + make your own maps or use many of Bob B's.
UI-view + Precision Mapping.
APRSpoint + Mappoint.
Winaprs + Precision Mapping.
pocketAPRS for palms and APRSce for other handhelds.
There are versions that i have probably missed.
I registered APRS+SA,Winaprs,PocketAPRS and DosAPRS.
Here again it is a group or personal preference.

What are the names of the columns inb APRS that shows you the
hear stations and the stations you are tracking? I recall once when
I ran Jeff's tracker, I clicked on a station in one column to move it
over to the column filled with callsigns that were displayed in SA.

The KPC3+ has two ports, allowing you to connect a GPS reciever
to it. For those using an older TNC with only one port, I assume
they have to connect the GPS to a second port on the laptop. Is

that true?

I use Pico with my KPC3+ because Normal doesn't work with
it. If I remember none of the other choices worked either.

I don't believe there should be a standard. I suggest you
tell the reader where he/she can get more information on how
to use APRS and let them decide for themselves.
Street Atlas does not stay where you zoom it to. It is under
the control of APRS+. APRS+ will change your zoom level
based on the settings you set in APRS+. It would be nice if
you could change the zoom in Street
Atlas and have it stay there but APRS+ doesn't know what you
did in Street Atlas.

The three columns are 'Stationary', 'Moving', and 'Tracking
List'. You double click on a station in the 'Moving' list
and that adds the station to the 'Tracking List'. You click
on the box for ENABLE TRACKING and Auto Map Update to have

APRS+ update Street Atlas when a position is received from any station in the 'Tracking List'. With this method you only show the last station tracked on the map. You cannot have multiple stations on the map at the same time. I no longer use this method (well not always). Randy has shown me how to use the Maps tab in APRS+ to display several stations at the same time. You still place the stations you want to track in the 'Tracking List'(on the Track tab) and I think you still select ENABLE TRACKING (Randy?) but DON'T select Auto Map Update. Instead go to the Maps page by selecting the Maps tab. On this page select Map4 by clicking the 'Select Maps' tab and clicking on Map4. Map4 is called Latest-Tracked (I'm not sure what the difference is between Map4 and Map3 which is called All-Tracked). Near the top of the page is a box where you enter the how often in seconds that you want the map to update. I usually use 30 seconds. Next you click on the box called 'Enabled' which does the same thing as ENABLE TRACKING on the Track page. Now your Street Atlas map will be updated every 30 seconds(or whatever you set) with the last known positions of each station your tracking. You select the amount of zoom in map options. There are two ways to get to map options. The simple way is to click on the Maps button (not the Maps tab) and your there. Next click on the 'Center & Mag' tab. Here you can select a fixed magnitude or a Min and Max magnitude. I have used both. The important thing to remember is that APRS will set the center of the map in the center of the stations you are tracking therefore if you zoom in to much then your stations may be off the screen.

As you can see there is more than one way to track. The user should try both and decide what works for him/her.

I pretty much have documented the APRS settings for chasing balloons. I now need to document the TNC settings. When someone has a chance, can you look at your car's TNC and let me know your settings? The one I know now is the MYCALL. Other than that, I don't know what the settings should be.

I guess LT buffers need to be set up if you're connecting the GPS to the TNC's second comm port. Then you'd also have to set up the second comm port (I have that command already documented for TNCs on the near space capsule).

If you don't run a second comm port on the TNC then you must have the second port on your laptop. In that case I'll need to know what TNC settings are use and what APRS setting to change (if any).

Thanks for your help. I added three pages to Chapter 11 last night just explaining how to add the second comm port to the TNC and how to connect the GPS and HT.

From: BLOHM,BILL (HP-Boise,ex1)
Topic: 2663 Message: 5440

I was discussing the TNC settings with the other Bill (KD7MJC) and raised a couple of points he suggested I pass on.

If it's not already explicitly set in the list of recommended TVNSP TNC settings, set the TNC to reject connect attempts. Failing to do so will really drain the batteries if someone decides to connect to the TNC and leave a message in the pbbs, for example.

Since the control operator may need to access the TNC to modify a parameter or two, also set up for remote access. This will allow you to refuse connections but still allow gaining control of the TNC in an emergency.

Another that might be worth looking at is to set up the TNC to only allow connections from specified call signs.

It does not exactly freeze the zoom level, it just keeps all tracked stations on the map.
So if one chase station was really lost,it could result in a low zoom rate (zoomed out to 10 or 12 mag.?). If everyone is within 5 or 10 miles
of the balloon,then you stay zoomed in around 14 to 18 mag.
SA uses the maximum magnification (zoom in) level to fit all "tracked" objects on the map determined by APRSplus.
This make sense ?

Another trick i found on the last chase. In the "position 2" tab,right click and bring up a menu box. Check "Turn ON Range/Bearing Update"
This keeps you updated on the range and bearing that "you" are from the balloon and other chase members.

This is the one weak point of APRS+; poor documentation.%#@!!

Here are the settings i use for everyday aprs use.
It covers KPC's and PacComms pretty well.
Once again milage may vary.
One Note not to overlook: If using a KPC+ the INT command
should be set to "TERMINAL" and GPSPORT needs to be set
to "4800 NORMAL CHECKSUM".

http://nwaprs.org/aprssettings.htm#MobileKPC-3

I only change the BT,BLT,GPShead and LTP commands for chases.
I have the BT say something about the launch.
I just use BLT 1 00:05:00. Is this too low or high?
GPShead 1 is set to $GPGGA
LTP 1 is set to GPSLV via relay,wide2-2
I have a separate "initkpc3.tnc" file which i load into the tnc
before launch.

My itty bitty input. Happy Holidays.

I would keep the TNC user information as generic as possible. Not everyone uses KPC-3+ TNC. And the way electronics change, it could be out of date before it is published.

My half-cents worth.
JohnK (a non-KPC user)

FYI you can also download a PDF version from Kantronics. I keep one on the laptop so I have it available. (If I don't have the laptop I won't be changing parameters anyway.)

Poor heck! Poor would be an improvement! It's non-existent!

I love the program and think it's far better in many ways than the other alternatives, but I sure wish Brent would document more. There are obviously some really cool things you can do, but you're gonna have to ask how! (for instance - you can do path substitution based on several factors - I've got a sketchy outline but not enough to really work from)

I think it was John that mentioned being careful of using Kantronics specific commands since not everybody uses them. I'll expand that to mention that most people are gonna stick with the APRS client program that they know. We did some testing prior to the Women's Challenge bike race. The way that some features are implemented is far different in the other programs. I can find strengths in each of them and weaknesses too. I, personally, am quite happy with APRS+SA but your chances of getting people to switch are low.

It's probably reasonable. I've got 3 alternating paths set up, but effectively I beacon every 5 minutes too.

>GPShead 1 is set to $GPGGA

I generally use the $GPRMC string because it gives heading and speed so it permits dead reckoning. I figure my altitude should be at ground level. (I hope!)

In the bike race trackers we use both strings so we can do an altitude profile display. AFAIK that's a WinAPRS feature. I don't know of a way to do it in APRS+SA.

Paul - You probably should note in your book that you must have a KPC3+ with version 8.3 (or higher) firmware to support the GPSPORT. It is not available prior to version 8.3. I know that KPC3+ TNCs were built with 8.2 firmware and I've heard rumors that they had at least one earlier version too.

An upgrade is available from Kantronics but it's relatively spendy. (About $60 last I checked.)

It's not so much the the users guide that I need to see, I just need to know what has been useful to us during chase. I guess I'm looking for real world examples.

I'll use the guide when I need to explain the settings.

OOp's
I use $GPRMC for chase also. For everyday use i alternate with
$GPGGA.

Referring back to an earlier post about "no" documentation,i
was a little unfair. The below link has some good help for beginners.
It would just be nicer if it was in the program ;)
The Canadian link is really good to a point,just never finished.

John brings up a good point.

I would not focus too much on the KPC's.
Even though they are the best TNC's for "doing it all"
with APRS. All other tnc's are very useful and adequate
for the casual APRS tracker and base monitoring station.
We don't want to make newbies think they cannot
participate because they don't have a Kantronic tnc.
Even a soundcard will will alow participation.

This was one of the problems in the early days of APRS.
Everyone thought you had to have a gps to play.
Make sure people understand any tnc will work.

For a balloon however,KPC's or TT's do rule
for now.

Hi Paul,

I've found the LTR feature in the KPC3+ V8.x to be especially useful as a postflight record of selected NMEA sentences. IF you tell it to log the $GPGGA sentence at a 30 sec or longer beacon rate and give 32K of RAM to the LTR, you can get the full record of a flight from launch to post-recovery shutdown. I've even tracked the parachute drag over 100 yards after landing! Of course, this applies only to the balloon-borne APRS module :=}

Hi Randy,

Well, I could transcribe Kantronic's excellent instructions in the
KPC+ User Manual here, but I won't 'cuz you'll need to set things
up specific to your own needs. But I will point you to the
LTRACK and LTR commands (the latter is available only from the PBBS!)
LTRACK sets up the log, and LTR reads it back. Best to set PBBS 32
or less to make room for plenty of LTR log space. Don't enable
time stamping in LTRACK - it's redundant to the UTC time already
in the $GPGGA sentence and just takes up room. If you want to
read the full LTR log, just enter the PBBS from the serial port
and say:
LTR 1000
That will pull back the full log, up to 1000 entries, whcih is more
than the LTR can hold. This will yield a 32K byte listing in
INVERSE time order (newest entry first, oldest last). Once you've
saved that dump to a .txt file, you can import it to Office Excel
as a comma-delimited file, sort by UTC time, convert m to ft and
plot alt vs. time, etc.
But please do read the book - you'll need it!

Hi Randy,

Great! It's very important to keep that manual handy. I bring it out
to the launch site in case there's a last-minute hoo-hah that needs
fixed!

And yeah - the LTR command is accessible only thru your PBBS. But
MYPBBS is most likely NOT your PBBS alias - in fact, I'd recommend that
you not use that one, since it's a special keyword used to blow away
a user who is tying the box up: from the console at the command line:
DISCONNECT MYPBBS will do it. This will also work if you're into
your mailbox as sysop thru the console, and accidentally get out via
a <ctrl-C> rather than Bye. BTW, the way you get into the mailbox
from the console is: Connect <my pbbs alias>
Now, the LTR command is also available over the radio port is you
don't set the SYSOP switch on the LTRACK command. This could be a
blessing or a curse. If you do want to have access to the LTR via
the radio port but restrict it to all other users, then set the
SYSOP switch and go into the remote sysop mode via the radio port;
this mode is essentially identical to being on the serial port, but
you do have to be VERY careful about some of the commands that can
RESET or RESTART the TNC! See the book on Remote Sysop mode.

73 es Merry Xmas!

From: verhap@occ1.sd01.k12.id.us
Topic: 3093 Message: 5457

Well, that was a nice time.

When I left Caldwell, all was fine. When I left Boise, the snow started up. It took and additional hour to reach Twin Falls. I couldn't drive the speed limit until I was near SLC. In Alamogordo they received enough snow to close the main road for a couple of hours. I missed going to the mineral display in Scorro, but did get a load of laundry done instead. The sun shines south of Salt Lake City.

I have a couple of notes I'd like to share.

Kitaro has a song called Howling Thunder. Mike, can we put part of it on the webpage? I'd like it as a "theme" song for TVNSP. I can drop off the CD if you'd like. What limits are there regarding us putting some copyrighted music on our webpage?

How about a motto for TVNSP? I was thinking of the following, "It's not just amateur science, it's an adventure".

Randy, can I stop by during winter break and show you the settings I'm documenting for the TNC and APRS? I'd like to run through each one and verify they make sense. Call me at 631-7162, as I won't be back into the office until Monday.

Do we know enough details to publish TVNSP's planned launches on the website?

Paul,

I don't know the song but I'll vote for the motto.
I think it's to early to post next year's flights but how
about the BASIC Stamp classes? What date is the first class?
Was it the first Saturday in January? What time? I think the
time was 12 or 1 pm.
Can someone confirm?

Paul,

It this the Kitaro song (it's only a clip)?

Mike,

That's the song. I recognize it now that I've heard it. Paul
has played it for us.

We'll start the second Saturday.

I don't recall the time, but we need to select one. The doors at the campus are locked and someone has to stand by them to let people in.

The second Saturday in January is the 11th.
I suggest we start at 1 pm.
Can we make this official? Does this work for most of us?

Hi Stephanie,

That's means you would only miss the first three classes. There will likely
be several classes.
The class material can be sent to you and I'd be more than happy to help you
catch up. I'll bet some others would help too. We can always meet before
class at my house to finish our homework at the last second.

5467. ARHAB Records - 2002 Q4 update

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-12-31 14:01:22 UTC
From: Ralph Wallio, W0RPK
Topic: 5467 Message: 5467

My thanks to everyone for another great year of Amateur Radio High Altitude Ballooning! We established seven new 1-2-3 records in 2002. Rumor has it we will see even more in 2003. Keep 'em coming folks. Record entries define our collective state-of-the-art.

Note that *Ratio of Released v. Recovered Payloads* has been changed to *Total Missions Flown*. New entries and revised counts are encouraged.

See http://users.crosspaths.net/wallio/RECORDS.html for all record entries and details.

Yes you mentioned it. I voted for it. I don't think anyone else has yet.

I have an idea for a TVNSP Motto*. How's this,

It's not just amateur science, it's an adventure.

Paul

I'll see if I can go. I can bring my small capsule and some photographs.

The high power rocketry group in Boise is meeting this Friday at
the Idaho Pizza on Glenwood and State at 7:00 PM. I plan to visit
with them and show what TVNSP has accomplished. Is anyone
else interested in visiting with them?

Paul

Tony,

Go to HABLIC's web site and click on RGS Recovery Guidance System.

http://cosmos.ssol.iastate.edu/HABET/

The biggest problem is the parafoil. They are very expensive or if you decide to make one they are difficult to make.
Here are some other links of interest.

Subject: [tvnsp] Active Descent Control

Hello TVNSP members,

I’ve been thinking about this for a while, and with the Basic Stamp classes coming up, I’m thinking this might be a project we should consider.

What if we had some more control over the “flight” path during descent? I read once about a balloon group that dropped a glider with a GPS driven “homing” autopilot in it. The glider landed within about 60 meters of the launch point (as programmed) after a three hour 60 mile balloon flight.

In these modern times both military and sport skydivers use steerable parachutes. Why not put a steerable parachute on our capsules? We could steer it from the ground, or we could develop some kind of autopilot. My point is, that when flying over Idaho, having just a little bit of descent control could greatly enhance our chances of a safe, speedy, and convenient recovery.

I don’t know about all the flight rules, but if the capsules were really gliders we might be able to land just as soft or softer with no parachute at all. I realize the gliders are more like rocks above 20,000 feet, but if we could somehow get these craft into a gliding attitude by 10,000 feet, …

Using the Alinco HTs it seems there is a receiver already onboard that is using battery power but not doing much of anything else most of the time. Perhaps we decode DTMF tones to control “flight”. I’ve never skydived, but from what I’ve seen, they just have a couple of control lines that they pull one way or another to steer. Even just rudder control could be enough to keep a glider out of the river.

Any interest in developing Active Descent Controls?

Your comments, both negative and positive, are invited.

Tony –
